ROTFL. A very good joke. Do you really believe Micro$oft found a better
way? The only intention of Billy is to rule the market. To achieve this
every move, even if it breaks the rules, is good enough for him.

Totally agree with you.

>>85% use Win95, 98 or NT...
>
>Yeah! 85% of the population has some kind of herpes virus... Is
>got to be good then.

Agree. Furthermore if one take in consideration that every pc that go over
the counter these days comes with Window$-whatever and Internet Explorer
already installed it's not difficult to understand why MS products are so
widely used.
I guess that 80% of the pc users even doesn't know there exist other OS's,
browsers, mailers etc then the one they got when they bought their pc.
Of the remaining 20% I guess that 15% of them saw the light and are using
other OS's, browsers, mailers, etc.
What left is 5% who enjoy Window$ and IE

>We are all entitled to our own opinions and it's good to discuss

>desitions to follow the crowd is in my humble opinion totally
>unacceptable, but of course... that is just me.

It's my humble opinion too.

>in the prefs file and the old pop-up menus should return instead of
>the AES attached-menus.

Following that advice, I decided to have another go with v0.96 and
yes, it works! No more attached menus, but no more lockups either.
Pity that wasn't documented in the WHATS.NEW file. ;-) The
Experimental variable *is* mentioned, but it only talks about the
first option which gives the menu items a background colour.

Can you tell us exactly what all the experimental options are, so we
can play with them to see if we like them?!

Also, I posted some time ago that I couldn't get Newsie's FTP facility
to display a file listing. I managed to solve that (I think) by
unchecking the "Use PORT command instead of PASV" option. However,
annoyingly it doesn't display the "." and ".." entries, so to move
upwards in the directory structure I have to close the server, edit
the pathname manually, and open it again. Is this a fault of the ISP,
where the is not responding properly to an "ls" command?

Another annoying problem is that, even though I have the "remember
directory" option unchecked, the FTP facility always saves the last
directory I accessed - so I keep having to edit the pathname manually
after I've finished. Am I doing something wrong?

5. Anyone bought from Pat Barnes?

Newsgroup: comp.sys.atari.st
Date: 2000-07-01 00:00:00 UTC
From: "Mark A. Mariani" <au576@lafn.org>
Message-ID: <395E0BEF.EA50D1F@lafn.org>
Source record: 60200

On 5/23 I replied to Pat Barnes who posted in this newsgroup that he had some Atari stuff for sale, and I asked if he had some SM124 monitors. He replied yes, and I sent a check to him on 5/25 for $66 to buy two of these monitors. The check was cashed on 6/2, and I still haven't received the monitors.

I emailed him again, and on 6/16 I got the response that the monitors are "in the mail" on their way to me. That was the last response I got. I wrote back several more times, but nothing more happened as of yet. This guy lives in Anchorage, Alaska.

I have bought numerous Atari items this way, and this is the first time that someone has not sent me what I payed for. Anyone else had this experience, and any suggestions on what I can do about it? Thanks.

Mark,

Would this "Pat Barnes" fellow happen to live at the below address?
5340 E. 42ND AVE.
Anchorage, AK. 99508-5710

I ordered a 28.8 modem from him on eBay on May 25th and it took a long time
for it to arrive. He didn't return my e-mails either. I spoke to another
buyer on eBay who left negative feedback and he hadn't received his item the
last time I spoke to him.

This may be the same guy. If it is, I suggest we post his known alaises on
this newsgroup so other Atarians can avoid him.

Hello Erik,

>MyMAIL looks for the home directory to load/store data fromin mint it is
>easy to do a new login in a bash shell in paralell with the old login and
>from that shell start a new session of mymail.
>I do not think this will work on magic.
If Mymail would be an IConnect client then this would be just as easy to
achieve.... one could use a little Gemscript file to do this.
A script like this has already been written by Jï¿½rgen Koneczny, one single
mouse click starts IConnect, makes the connection to the first ISP, when the
mail is retrieved from the POPserver, it does a new login to another POP
account... etc.
When all the mail and news has been retrieved and posted from the respective
POP accounts, IConnect then disconnects the connection with the ISP. This not
only saves time but also money, and it's very simple to use...
One needs MagiC, ASH Scripter and IConnect for this.

Cheers from Belgium
Dennis

Galen - I beleive that it implements the calls build in to MagiC 6. As to the actual differences I do have any idea :)

Don't believe the joystick/mouse ports can't break repeatedly. I
repaired my joystick/mouse ports 3 times before I got the joystick
extenders. Try re-soldering them again to see if it cures the problem.
It's cheaper than replacing the keyboard :)

>Just wondering if anyone has any broken ST's etc with the internal
>keyboard unit still intact and might be willing to sell it. Not sure if
>the internal keyboard unit that plugs into the motherboard is the same
>on other ST's as the 520STFM. ie 1040, STE etc. Anyone got any info on
>this?

The keyboards in the STs are the same, or seem to be. The keyboard in my
520STE came from a broken 1040STE. The keyboard in my old 520FM has been
used in the 520STE as well, while the E's keyboard was waiting to have
the orange juice cleaned from it[1]. I don't know if the Falcons
keyboard is the same as the STs, but it wouldn't surprise me if it did.

[1] just goes to show that sometimes kids and computers don't mix very
well.

Hallo Martin \"Nightowl\"!

MB>Now I wonder why Newsie has problems with NVDI.

Well, on my CT2A Falcon with MagiC 6 and NVDI 5 Newsie 0.96 works flawlessly. I can even use a Speedo-font in the article overview with no problems.
The only new problem with newsie 0.96 is that it's crashing with bombs on my Milan 040 every time I quit the program.
With 0.94 on the Milan, I had crashes when double-clicking in the ftp window. Single-click plus selection with return did work, though. Haven't checked that with 0.96 yet.

I do not use Newsie for newsreading, but only for e-mail and a little ftp on the Falcon. On the Milan, my current favourite is AMail, due to the drag and drop attachment handling. But with an inbox of roughly 100 mails, several of these having large attachments, opening and closing the inbox is _extremely_ slow :-(

Hehe, yeah it probably figures that Atari got some cheaper deal on red leds
at some point. The model I've got did come with one of the single sided disk
drives which I had to replace with a double sided, as it came apparent that
none of the software coming out was working :P

I'm in Leicester, UK.

Cheers for your help and expertise. much appreciated.

Stav

No not everyone, I do have costs to cover as I do quite a bit for the Atari community and NOT only pd:) I do try and cover my costs (one can dream I suppose), but it does cost money (arghh! that word again!) tracking software down for people.

What's more there are still some LICENCEWARE authors out there that you can't get over the internet or BBS's, and you can't really get an after sales service from an internet line:)

Hiya

Unfortunately not everyone is as honest as we all had liked to be:(
about 5% are there just to fill the pockets with other peoples hard
work!

There's no real way around this, and the internet can make it easier for
them:(

I must admit, most hassle I've had is with Parcel (does this thing
bounce) Force!

There is a web site, I ought to help publicize this for them:

http://home.sol.no/~olavese/avoids.htm

Get the person's name added to this site:)))

I don't have anything to do with this site, it's something I came across
a while back and filed it as..... Well it didn't get filed and is still
floating around in my fav's menu.

Maybe I may do something similar on my www.atarian.com site, what do you
think? good idea or bad?

It won't be spectacular but functional!

Hi

I can't say much about a PD drive an a Falcon, but I had NO problems
with a Mega STE, Mega ST4 and STE with a PD drive.

IIRC I did have to have a CD driver installed though (ExtenDOS Pro).

I can't remember which way around the ID numbers work, but the CD and
the optical side have different LUN numbers, so will/should show up as
TWO devices/drives!

True, but a lot of software will allow you to post a mail to that
address. It would be sent to their ISP and gets routed inside the
network. What happens once it's inside the ISPs mail system depends on
how it's configured. If they've got [username]@localhost mapped to
[username]@[whatever.com] then it'll work. If not, it won't.

- Last Updated 07/01/00
- Sold items removed

I have a limited amount of brand new Atari Jaguar items for sale or trade. These packages are ideal for new collector's or somebody wanting to start or add to their Atari collection. If you have any questions, please feel free to ask. I am also willing to trade for certain items, please see my list at the end of this post. All prices quoted are in U.S. funds with the buyer paying shipping.

If you are interested in any of these items, please respond to me by using this automated link jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.Jaguar (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

** Atari Jaguar Packages - Brand New (with controller, RF Box & AC adapter)**
==========
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $45
- Atari Jaguar with CyberMorph cartridge $35
- Atari Jaguar (No Cart) $25

** Atari Jaguar Accessories - New**
==========
- Jaguar unit alone (No power supply, controller or accessories) $20
- Team Tap (4 Player adapter) $30
- Composite Video Cable $15
- Spare Controller $15
- AC Power Supply $15
- RF Switch Box $10

** Atari Jaguar Games - New/Shrink-wrapped**
==========
- Checkered Flag $10
- CyberMorph $5 (No Box)

Atari Force Comics Please make an offer
==========

All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for/towards rare or sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- A working 6000 series Dish Network receiver
- Working DSS H or HU Cards
- And of course the ever popular, original Intellivision keyboard
- Atari Force Comics Issue #1 (January 1984), Issues 4 thru 7, and Issues 12 thru 20

26. Extract ATR files on an Atari

Newsgroup: comp.sys.atari.st
Date: 2000-07-01 00:00:00 UTC
From: ebaiz@skyenet.net
Message-ID: <XMt75.2846$JZ4.6884@newsfeed.slurp.net>
Source record: 60221

Just wondering if anyone knew how to extract the internal file(s) from an ATR file on an Atari computer. I can do it somewhat use an old file from Darek Mihocka called FXP. I first convert the ATR file into an XLD file. I then change the extension to SD and run the FXP program. It will extract the files to the Hades, but I am not sure if they are correct. I was just wondering if anyone else was doing it in a different way with different programs?

Hi John,

JMR>Thanks, I was hoping that some of the improvements were actually
JMR>being used.

I've never been able to send a new article to a ng, newsie does some action,
but the article never reaches it's destination.
Is there a log file where I could look up what had happened?

And, will the mime decode module get more features (long filenames, names w
spaces)?

Also, I'd like to have the attachments to be placed in an special folder, not
the work folder. Or otherwise, the work folder gets all working data, but the
mime decoder can be placed somewhere else (eg a modules folder).

BTW: can I use news servers that need name and password with newsie?

bye,
=Gerhard=

Hi,
Thanks for the clarification. It seems strange that the new 3.x version of CDRecorder doesn't support those, since MagiC has been around for some time now...
Isn't it possible with the "Atari" or "Don't care" setting? I only have 2.x and I'm currently waiting for an update, so I don't know about the new features in 3.x yet... I don't use any LFN partitions - only normal TOS - but a program which is so good in most other respects should absolutely support all available formats.

Best regards,
Claes

Galen,

Based on comments I've seen from other users, SyQuest drives seem to either work really well or not at all. I've been using an external SparQ drive and two cartirdges for over two years on my PC and have had no problems. It's gotten knocked about a bit (I'm a graphic designer and it's used to bring large files to the printing companies) but still works as good as new and has given me absolutely NO headaches (knock on wood).

Perhaps you had a defective SyJet drive. If the drive is defective, it will ruin any cartridges you put in it. Also, I found out that you cannot interchange SyJet and SparQ cartridges (will damage drives)! I've found http://www.syquestsupport.com to be a great place for technical help.

Bought my 520 in 1987, has red power/active lights not the green/orange for some strange reason. Anyone know why? Anyway, trying to get the ST back operational but the joystick port on the underside of the internal keyboard unit has broken. As far as im aware this cant be fixed by soldering as this was tried 5 years ago or so :/
Just wondering if anyone has any broken ST's etc with the internal keyboard unit still intact and might be willing to sell it. Not sure if the internal keyboard unit that plugs into the motherboard is the same on other ST's as the 520STFM. ie 1040, STE etc. Anyone got any info on this?

Cheers,
Stav

Hi

I've seen several coloured LED's, I presume Atari got a discount for RED
led's:) Seriously red LED's consume less power so that may be a reason!

Usually the solder breaks away from the tracks. With patience it can be
fixed! I've done several;0

Sorry guys,
I've been away a while, I rode my Sinclair C5 from Abingdon to Glastonbury,
knackered is not enough to describer my state :-))...

ASP do a little converter/cable combo....If you've got only enough space
for a 3.5" drive inside the case (I'm not up on the MkX without trying to
dig out an old ST Floormat.....) then it isa 6.5 UKP for the converter and
a cable for a single drive and the PSU cable which will need adding to your
PSU, if you've got space for two drives (or a HD + a CDROM...) then it is
still 6.5 UKP but it doeesn't come with a PSU cable cos you ought to be
using a more powerful PSU than the Falcons standard one...

ASP
40 Evelin Road
Abingdon
OXON
OX14 1JR
UK, payment by cheque or money order in UKP only please :-))

Hmm.. my take on this is a bit wierrd...

My home Falcon has only SCSI drives, the one that is used as a CD imager is
a fairly quick 2Gb IBM DPES drive (IIRC) ...it's a 5400 rpm/10ms thing from
memory....I've just got a Yamaha 4260 to replace the old CDR200 that I've
got and at home it won't burn at 4x, it doens't even get offered as an
option, I'll report back when IO get it to the studio where my other Falcon
has a 4.5Gb IBM DHEA EIDE drive 7200rpm/9ms and see if that is any
different....that sadi never really had aproblem t`with the old drive
except that it didn't like Audio CDR....which was a pain..

I have that trouble if 'Author' is'nt filled with my name on a new post
(name should already be there if it's a follow-up)
Not sure if 'Subject' needs to be filled in
Also, I 'x' the box for 'Newsgroup' and 'Author'.

Can't answer that one but since you've got a 'wish list going':
I'd like to see Upper case extensions implimented for standard the
file selector. It now saves/loads as .htm or .txt for example which
does'nt allow the list to be shown unless the extension is changed
manually (it will save OK but at the risk of overwriting a file with
the same name!). No automatic extension inserted into the selector would
work for me too. All this in the absence of changing the selector!

>BTW: can I use news servers that need name and password with newsie?

Works for me. I believe the password from the 'Mail' option is used.

No, but I'm still having trouble getting Everest and Cab to work together,
ie edit and save a HTML file, Cab should then redraw it, but doesn't.

I could still do with an English doc for the latest Olga, as the one you
gave me still seems to be in German.

:(

Cheers!

Source record: 60152

Hello,

I just recently re-acquired a Mega STe (I had one eons ago) and have a
few questions! (It is like learning a new language!)

The bundle I got was VERY generously supplied with all of my software
wants (I should think!) so I have a few hardware questions:

1. Can the graphics ont he Mega STe be enhanced in any way? Any
expansion boards, etc?

2. Is there any easy way to get an Epson 600 Printer to work with this?
It has a paralell port, but I suspect it needs a driver or something similar.

Thanks!

-Marlin

53. Sound problems in Extendos and Audio CD

Hello,

Newly acquired Mega STe here and I can not seem to get Audio CDs to play correctly. I launch the AudioCD DA and it seems to play (access light and the prog display acts normal) BUT no sound comes out! Also, if I try to move the sound slider box on the app "up" it just pops back to the "0" position.

Any help would be appreciated!

Thanks
-Marlin

>And with Newsie I've never managed to post an article ...

There's Okami which is an off-line reader but that needs something like
Newswatch and POPwatch to fetch the news and mail. It may be difficult
to initially configure but it was about the best newsreader for TOS, as
well as Mint and Magic, when I last used it (~1 year ago). It's still
being developed so is probably even better now than it was.

Hi Derryck

>I've just bought CD Recorder Pro, but it's lacking LFN support, and I
>can't see that Soundpool's latest version supports it either.

Do you have it switched on in VFAT-CNF, if its not enabled in MAGX.INF
then you wont see them anyway, even if you did record them?.

What about Okami 2.x. It's the *best* and most versatile news/mail reader
around for the Atari. The only drawback (for some people) is that's a
offliner so you need for instance Popwatch and Newswatch to retrieve/send
mails and news.
Both Popwatch and Newswatch works very good with STing/STik/Gluestik.

Hello again,

I will apologize in advance for all of my questions over the next few days, months, years (!)

As some of you might know by now, I have re-acquired a Mega STe. It came with plenty of software and, well, I need the short course in all of this new stuff!

Question one: How do I get on the net with the STe? I seem to have something called STing installed as well as CAB. I know that CAB is a web browser, but how do I get the ST hooked up over a PPP/Slip connection?

Question Two: Can the STe do 57k via modem? Curious about that.

Other questions will be coming as they arise! :-)

Thanks
-Marlin

|soldering as this was tried 5 years ago or so :/

If it really is the port it ought to be fixable. I re-soldered one
of mine some years ago. The solder joints in the inner row of
connectors were hard to get at - I have a feeling I got a new port
as I melted the old one but it was some years ago and is all a bit
hazy. Have you tried putting in a new port?

there were a number of video boards available for the MegaSTe - it
uses the same VME expansion slot as the TT. Two that come to mind are
the ones that were made by Cyrel and the Crazy Dots board, I also recall
a Nova card that uses the same slot. Mario Becroft, a young fellow out
in New Zealand, is currently working on a new VME video card.

Plug the speakers into th front of the cdrom, you can make an adaptor using
a couple of resistors to mix STE and CD audio.

Message-ID: <39606205.A94C5B2B@rka.com.au>
Source record: 60164

Hi,

I've found some clock programs for ST in the .acc format, but I don't know how to run them so they integrate with the programs I use; also, I don't know where to find them once a program is running - ie, on the menu etc. I have a Mega ST4, and it has 2 slots for backup batteries, which I was told keeps the clock time.... now, if I can just get a clock to load with my Cubase etc. I recently discovered the auto-folder idea (I only have floppies, no hard drive), but I know .acc files load differently. Would appreciate some help!

Thanks,

Matthew.

Hmm, well, this sounds interesting and I appreciate the answer, but I am
still curious as to what the problem is with my system (if any). I mean
why am I not able to get the music on the STe, it seems like I should.
OR, is that just it, I can not?

There is a button on the accessory that says "record" so I am assuming
that music can get in to the STe.

Thanks again for the help.

Hey don't worry!

>I mean
>why am I not able to get the music on the STe, it seems like I should.
>OR, is that just it, I can not?

I have an IDE cd-rom (you probably have SCSI) and AFAIK when you play
an audio CD using the controls on the front of the CDROM or software
the audio doesn't get transferred over the IDE/SCSI cables, it comes
from the audio port.

The STe motherboard hasn't got a socket for audio like PC soundcards.
You can either :

(1) Use the headphones connected to the headphone socket on the front
of the CDROM.

(2) Use the RCAs on the back of the CDROM connected to a amplifier.
(if you have them)

(3) Make a nice little circuit to send the audio into the STe
motherboard. This has the advantage of controlling the Treble, Bass
and volume of the CD audio.

>There is a button on the accessory that says "record" so I am assuming
>that music can get in to the STe.

Yes you record parts of the CD (or all of it!) to the hard drive. Then
play it of the hard drive. Watch out as it can eat up a lot of hard
drive space! (600mb at top quality!)

I rang up System Solutions about 3 years ago and they said they can't
get hold of them anymore. Lighthouse Tower is still available.

The Desktopper doesn't sound very good to me. AFAIK it still keeps
the bottom of the case and just replaces the top part of the case.

I cased my STe in a PC full tower case. It took some dedication and
patience but I'm very pleased with the results.
It looks cool too. I had to cut a little Atari logo out of an old
Atari World to stick on the little square on the front. :-)

86. 720K read/write on PC Info

Newsgroup: comp.sys.atari.st
Date: 2000-07-03 00:00:00 UTC
From: Tim Conrardy <tconrardy@hotmail.com>
Message-ID: <8jqdu3$ni1$1@nnrp1.deja.com>
Source record: 60169

Hello All:

Recently on the Atari-Midi mailing list there has been a thread going about
reading/writing 720K discs on Win 98. It seemed that some people were having
no problems with Win 95, while others were having problems with Win 98.
One of our members (Donald Skaggs)performed some experiments and below are
his conclusions. Looks like good research.

Nicholas (Bales): If you are reading this, perhaps this should be added to
the Atari Faq as this is a recent Bug that has been an issue lately.

Tim Conrardy

****
Tim's Atari Midi World http://atari.atlantis-bbs.com
Mirror Site: http://sites.netscape.net/timconrardy/index.htm
Atari-Midi Mailing List:http://www.egroups.com/group/atari-midi
---

Can't read or write 720K disks between the PC and ATARI? Get Blue screen
with error messages on the PC and can't read files on the ATARI?

Most likely a program is interfering with this function in Windows or the
disk is not formatted for DOS on TOS 1.0/1.02. as long names on Windows are
unreadable on the ATARI.

How do you know if you have TOS 1.0/1.02? Hit CNTRL/ALT/DEL together and
let go. Does the ATARI reboot? NO? Well then you have TOS 1.0/1.02. These
early TOS versions do not format for DOS on their own but it can be done
with a program called Maxifile--and others.

Now that you have a DOS formatted 720K disk you find Windows gets a ton of
errors when you try to read or write from the 720K disk. Now what? You have
two options:

1) Since the problem is MOST LIKELY NOT in Windows itself start uninstalling
programs on the W9X machine until the bug goes away. Then get a version

of
the problem program that does not interfere with the 720K disk
read/write
operation. You can only experimment with that to see.

2) Start from scratch. Reformat your drive. Reload W9X and try
Read/Write
functions to 720K disks after each program install. Windows on it's own
will
most likely handle 720 ATARI/PC DOS disks fine. However there are
programs
that clobber that operation in W9X.----EZCD CREATOR DELUXE from Adaptec
for
one. Earlier versions worked fine with no intereference with the 720K
DOS
disk read/write operation.

Now that you have figured out what Windows program is clobbering your
ATARI/PC 720K DOS disk operation then you find that that MIDI file (or
other) copied to the DOS disk will not read on the ATARI.What's the deal
with this?

Long names (any file name greater than wxyzwxyz.xyz i.e eight
characters in
the prefix and three characters in the suffix) are unrecognised on the
ATARI
(at least on the early verisons of TOS and probably later
versions).Even if
you rewrite the name of the PC file to the eight character ATARI prefix
limit on either the PC or ATARI the PC has written garbage to the disk
and
the file will be unreadable on the ATARI. Bummer.

You can always read/write 720K ATARI/PC DOS disks in Windows SAFE MODE
(F8
during W9X bootup).

>make a difference between the english and the local "Reply" (well -
>the reason is pretty obvious, isn't it?)...

Unless I'm greatly mistaken, the Re: isn't English anyway, it's Latin,
hence international, though it's usage derives from English business
correspondance. It also doesn't have any meaning relating to replying,
per se. It's always been used in such correspondance both for new
messages and when replying, and is an abbreviation of "in re" or
somesuch Latin phrase which loosely translates as "regarding the
thing/matter" (re meaning a thing) or "concerning", as in "concerning:
whatever-the-subject-is".

BTW Microsoft obviously haven't sussed this out, which doesn't say much
for the company selling the most popular business software suite...

I have no specific solution, but you can always try this:
http://ftp.lip6.fr/pub/atari/Falcon/Graphics/rez_fool.lzh
It will only work if the demo does not need a RGB-only resolution, and (in
case you wonder) yes, it can damage your monitor, so you are on your own...

93. Re: clock .acc files

In article <39606205.A94C5B2B@rka.com.au>, Matthew and Caroline Simpson-Morgan <mcsm@rka.com.au> writes
>Hi,
>
>I've found some clock programs for ST in the .acc format, but I don't
>know how to run them so they integrate with the programs I use;

Programs/files with the .ACC extension are 'Desktop Accessories', they load in on boot-up, or resolution change, and sit their waiting for something to do.

They cover a wide variety of applications:

Fastcopy is a disk copier
Harlekin is a bit of everything

You could call it a crude multi-tasking.

On my machine I have several, including the CPX control panel which is an extension of the accessory idea.

At default, unless you've got a program in your AUTO folder to alter it, the computer look in the ROOT directory of the boot drive, in your case drive A, for any .acc files. It then attempts to load them in, IN the order they are in the directory NOT as you see them when you open the disk.

Every now and again you will come across a couple of acc's that don't like each other and case the machine to bomb out! So if you want to play around with some, bear this in mind. 99% are OK with each other.

If you do keep bombing out on bootup, and it boots fine without acc's, try eliminating a program 1 by 1, or change the order they load in!

I mentioned that they come in all types of applications, well they also come as novelty items: a cat running after the mouse cursor, eyes following you around, and one called MITES; this doesn't show up in the menu (I think) but you see like pixels, sorry mites, on screen eating the image!!!

> also, I
>don't know where to find them once a program is running - ie, on the
>menu etc.

Some a totally invisible, but MOST are there on the menu bar on the top left, in the same menu that gives you the TOS copyright stuff.

Underneath the info are 6 space for up to 6 .acc programs. There are program that help you extend that.

>I have a Mega ST4, and it has 2 slots for backup batteries,
>which I was told keeps the clock time....

You can set the time using Atari's Control Panel, yes it's an .ACC program:) If you have a language disk, it should be on it. This allows you to customise some of the Desktop to your liking: Colour, mouse speed, keyboard, printer etc...

There is 2 types of control panel, one you can change your serial port aspects and one you can't, in which case there will be another ACC program on the language disk.

> now, if I can just get a clock
>to load with my Cubase etc.

I don't quite understand the question!!! If you are after a clock, as in clock program that shows you the ACTUAL time, then look for something called clock.acc.

> I recently discovered the auto-folder idea
>(I only have floppies, no hard drive), but I know .acc files load
>differently. Would appreciate some help!

As you are a floppy user, if you've got only one drive. Create yourself a small RAM disk and use it as a second drive, remember to save the data before you switch off.

If you have a 4 meg machine, you can easily create a 2 meg RAM disk, and use it as a hard drive. I use to do this before I got my hands on hard drive.

And yes, these come ACC's as well. The most novel is DC software's RAM-IT! (I hope I've got the right name! I'll be shot otherwise!) This actually treats the RAM disk as a physical disk, giving it track and sectors!!! It's the only one I've seen that does this, greatr if you want to make up a 720k disk in memory without having to mess around writing to floppy etc.

Can you be more specific? Where are you monitoring from?
ExtenDOS' CDAudio program does not play audio via the
host (so you will hear nothing coming from the computer).
The music will come out of either:

1. CD-ROM drive's headphone socket (maybe it's broken?)
2. CD-ROM SCSI casing's RCA sockets (not wired?)

What program are you using these ATR files with?

Like you said, with ST X-Former it was a simple matter of converting those
over. Not a bad emulator.

On 800 XL DJ, I have programs on the actual Atari 800 unconvert the ATR
image and create them and then save them on the ST's hard drive.

As for Atari800, EmuXL, couldn't tell you since I have not had an Atari
16/32 machine that was powerful enough to handle those.

Take care,

Doctor Clu

<<SNIP>>>

Hi!

Thats quite interesting. I've just bought an old 386 laptop and
have been playing around with it. I download programmes etc from
Atari with the internet connection then take it to PC using floppy disks.

One file was 760 something kilobytes so I formatted the disk on the ST
to 82 tracks and 10 sectors. TOS works fine with this format
(usually!) but Windows 3.1 came up with "disk is not formatted".

I found exiting Windows then using DOS was a lot more stable and didn't
care too much about type of format.
You'll have to learn those good old DOS commands again but it works
for me!

The CD cannot play through the computer directly. You have to plug
in headphones through the socket on the front panel or connect to a
hifi system via the socket at the back.

Can't help with slider.

Hi Matthew,

On 3 Jul 2000 19:51:03 +, Matthew and Caroline Simpson-Morgan wrote:

>.... now, if I can just get a clock
>to load with my Cubase etc.....

It has always been my experience that Cubase alters the computer clock anyway. I am told that it takes precedence over the timing and this in turn affects the clock. Also, I tried a clock acc many years ago (don't know which one) and Cubase definitely didn't like it.

It seems to be generally accepted that Cubase, whilst an excellent programme, has a few "cheats" in the code, and it is best run with as few "add-ons" around as possible.

Cheers

Paul

It's arguably the most configurable of all the clients out there - that was also its downfall IMHO. However, the latest version now allows many functions to be configured from within the prog, so is well worth a look!

Hello,

I was just wondering and would like an opinion. Which is the best kind or digital camera, the one that puts the pictures on a 3.5 inch disk or else the ones that have a cable and need to be hooked up to the computer so that images can be transfered?

Ed - the best are the ones that use memory cards. These can hold in excess of 64 mb (depending on type). Keep in mind that for a file that will produce a decent 4x6 or 5x7 inch print you are going to need about a 3 to 4 mb uncompressed image file (tif). Cameras that use a floppy are normally only 640x480 resolution, usefull for 72 dpi screen resolution only. If they do produce a higher resolution you are not going to get very many images on a 3.5 floppy even when saved as jpegs (and data transfer to the floppy is much slower than to the memory cards).

Ed,

Get a camera that can connect to a computer via Serial port, as I think the
Atari programs only support that method of transport.

112. Spectre GCR

Newsgroup: comp.sys.atari.st
Date: 2000-07-04 00:00:00 UTC
From: "Marlin Bates, IV" <mcb242@psu.edu>
Message-ID: <3962032F.4B40AC4E@psu.edu>
Source record: 60100

Hello all,

I need to know a couple of things about the Spectre GCR as it has been a
looooong time since I last had one. I realize that for a couple of bucks
I could get a Mac Plus (or even better) and blah blah blah, but that
isn't quite the point now is it!?!?! :-)

So, I would like to know the following:

What comes in a Spectre GCR package? The cartridge, a manual, and what?
If one just got a loose cartridge and ROMS, is there anywhere to find a
manual and (program disks?)

Also, what about the Spectre 128?

If anyone has a complete package floating around for sale for a
reasonable price PLEASE get in touch with me!

Thanks

-Marlin

113. Monitor trouble

Newsgroup: comp.sys.atari.st

From: al743@FreeNet.Carleton.CA
Message-ID: <8jt0fk$l7q$1@freenet9.carleton.ca>
Source record: 60101

If anyone out there can give me advice on how to fix an Atari monitor, please send me a note.
Description: It's an Atari monochrome monitor, model SM125. The screen went black and the pilot light went out. On taking it apart I found the second fuse blown (not the main one). When I replaced the fuse it blew again, obviously the trouble is somewhere else.
Not having a circuit diagram I am groping in the dark. If somebody has any suggestion where to look, I'd appreciate it.
Please e-mail to al743@ncf.carleton.ca if possible, or reply in the newsgroup.

A cartridge and a manual plus the obligatory promo literature is all I
remember getting. You were on your own to get the MAC ROMS, and they
were not easy to get with Apple being Apple. I don't know where to get
the manual or disks alone.
>
> Also, what about the Spectre 128?

I'm no help here.

I'd be willing to part with my GCR. It worked great on my TT years
ago. I've even got Ashton-Tate's Full Write Professional and Dbase III.

I'm in Colorado, USA. Email if you are interested.

I don't know about picture quality, but if all I had was Atari computers, I'd get the one that uses the disks for a couple of reasons. 1) They save in a standard format, such as TIFF or JPG, which means you can pop them in any computer anywhere anytime. None of the memory saving cameras can dump to the Atari platform AFAIK. There used to be a (French?) company that made a cable for connecting some of the early CASIO models, but I believe they are no longer around. 2) As long as you take extra floppies, you can take pictures until the batteries are dead. <G>

It seems most cameras have different resolutions you can choose from, so the number of pictures you can take depend on the chosen resolution and memory/# of floppies. As the resolution abilities of the camera get better, the floppy versions will be limited by the storage ability of the floppy.

Sony is the only floppy camera(s) that I know of, and they tend to be higher priced, too. There's more stuff to them because of the floppy business. Now that I've also got a Windows machine in addition to my Atari's, I don't know which type I'd get.

It's a RS424-port. You can either connect a modem (use a Mac
modem-cable) or use nullmodem-cables and MiNT-Net/STiNG to set up a
LAN. It's compatible with the Mac hardware-wise, but there's no AppleTalk
drivers available so you can't use AppleTalk. Perhaps it's possible to
connect it to a Mac using PPP or SLIP.

Hi,
I would suspect that the High Voltage transformer might have gone to the dogs.
If you can find such a transformer very cheap, it may be profitable - but it's probably better to buy an SVGA-monitor and use an adapter cable to give you the monochrome picture from your ST.
There are a couple of schematics here: http://www.fortunecity.com/skyscraper/quadra/455/ , but I don't remember if the SM125 is included there...

>(usually!) but Windows 3.1 came up with "disk is not formatted".

Not all disk drives can go above 81 tracks!! (0-80), even some Atari
drives can't go above 81 tracks. There are some drives that can do 85
tracks and beyond, although data security is at risk the nearer you get
to the hub!

>

There are the only three right now:
prefs.experimental[n]

0 =Y 04/02/99 Activates colored menu items, take on background color, color_menu(void)
1 =N 09/07/99 Prevent AES 3.3 and above menu_attach(). Anything else allows
2 =N 11/26/99 Prevent using my_form_do(). Anything else use my_form_do(), moveable
dialogs, cut, copy paste, etc.

>where the is not responding properly to an "ls" command?
>
Some servers do not support PASV, and so the PORT is provided. Since
I don't know which support which, NEWSie either:
1) relies on the preference being set or not
2) defaults to PASV and tries PORT if that fails.
Sometimes the default retry doesn't work as well as I would like,
again depending upon the FTP server configuration.

Some servers provide the '.' and '..', but some do not. NEWSie does
not create those entries if they do not exist in the server. The
Backspace key will always move up (i.e. higher in the path), so you
can utilize the Backspace key to do the equivalent of the '..'

function. You should not have to close, edit, and reopen the server to move up in the directory structure.

>Another annoying problem is that, even though I have the "remember
>directory" option unchecked, the FTP facility always saves the last
>directory I accessed - so I keep having to edit the pathname manually
>after I've finished. Am I doing something wrong?
>
I will look at this to see if somewhere the last directory is saved without the option being checked. Before the option existed, the method was to save the last directory, so I may have missed a situation where the option needs to be tested.

>Since the 2.x versions are restricted, I'll try it with 1.34 first.
>There's a lot of setup to do. How to I get O and Newswatch together?

You really should work with the latest beta. It's much better.

Anyway to get Newswatch working with 1.34 you must do the following:

1) o.inf
========
newsdir=d:\okami\spool\articles #adapt the path to your situation
mqueuedir=d:\okami\spool\mqueue #adapt the path to your situation

Use this with NOS or when importing rnews files. Newsgroups whose names
do not match the wildcard expressions will be imported in group `junk'.
#
active=sci.*
active=nl.*
active=comp.sys.atari.st
active=comp.sys.atari.tech
active=maus.*
active=ping.*
active=fr.comp.sys.atari

In active you list all the newsgroups you want to read

2) Newswatch:
=============
Program preferences: Retrieval Format: NOS
Incoming: d:\okami\spool\articles\
Outgoing: d:\okami\spool\mqueue\
History: d:\okami\spool\news\

Retrieval Methode: Article Number

3) \nwatch\nntp.dat --->This must look like this (my old setup)

news.antw.online.be 990918 0
comp.sys.atari.st 980123 175542 194768
comp.sys.atari.st.tech 980123 175522 41608

```
comp.sys.atari.announce 990417 0 308
maus.computer.atari.dtp 981027 0 8404
maus.computer.atari.internet 981005 0 5185
maus.computer.atari.mint_mtos 981005 0 3190
maus.computer.atari.hardware 981005 0 7975
maus.computer.atari.software 981005 0 17607
fr.comp.sys.atari 980710 0 33845

980710 0 33845
| | |-----> number of last retrieved message
| |
| |-----> Not important. Set it to '0'
|
|----> Not important: Use for instance the current date

If you start for the first time Newswatch you can set the last number to
"0"., thus 980710 0 0. One major drawback is that Newswatch will download,
depending of the setup of the newsserver of your ISP, lots of messages
now.
You can overcome this by aborting the download and add the number of
message ready for downloading you saw on the main newswatch window to the
number set in nntp.dat. For instance the main window says there are 600
message. After aborting the retrieval you will see that nntp.dat has been
changed. If you now add for instance 550 to the number in nntp.dat you
will see that the next time you start newswatch there will be only 50 (or
less) message to download.

I know this ask some work but it works.
If someone knows a better methode please let me know.

Remember the above description is only for Okami 1.34. Okami 2.1b-18 needs
another approach but this is clearly marked in the docs.

If you need my complet o.inf let me know. I'll send it to you.

HTH,
Martin

Itï¿½s an serial port, apple like, right.
No "appleTalk" software avaiable for any atari.
I use this port for modem and Neon dongle..

Also you can made a serial null modem, connect on other atari.
STinG also access LAN port.

Sorry I did not get it into the documentation. Sometimes trying
something new in the User Interface can cause some frustration, and
although I tried to get it right, I found that the menu_attach()
appears to have some occasional system lockups.

If somebody has any programming expertise on menu_attach() that might
help me determine why the flakiness is occurring, I would certainly
invite the help.

Does NVDI 5 have WDialog built in? If so there may be some
correlation. Someone else mentioned a GDOS/TOS compatibility option
on NVDI. On NVDI 3.02 I have TOS compatibility off, and GDOS on.

If you can determine that some NVDI parameter configuration prevents
the crash, perhaps I can find a way to prevent NEWSie from running
amuck with NVDI 5.

Those that put the image on PCMCIA cards I think are the best:)

The one I've got is restricted to the internal memory, depending what
picture quality you set it at.

Don't get one that uses the serial, as this is slow; instead go for a
USB one. Then you could use it as a web cam as well. Mine is both,
although I would prefer one with memory cards.

It would be interesting to be able to download to the Atari via the
serial!!

I got cartridge, manual, and software in a plastic library type case.
IIRC you had to buy the ROM's separately!

Wasn't the Spectre 128, the model WITH the Apple ROM's already fitted!!!

I think the Happy discovery cartridge docs did mention the 128.
Incidentally, the happy discovery cartridge claims to be able to do the
same as the Spectre!!!

The price for a Spectre is much cheaper than it was when it came out,
like a lot of things, I'd expect them to fetch ï¿½25 GBP (approx. $40 USD)
tops:)

Just curious as to which version of NEWSie you used when the posting
would not work. As long as you have a connection to a news server,
everything is pretty standard.

If you did get a failure in posting, there should be evidence in the
LOG file, providing you have the 'Log Server Commands' and 'Log
Response Headers' checked. In most servers, the response messages are
fairly understandable.

Ahh so there WAS software with it. I thought I remembered there being
software with it. Without the software, it was useless, right?

>
> Wasn't the Spectre 128, the model WITH the Apple ROM's already fitted!!!

See, now, I thought this was the version before the GCR. THe 128 did
not have the drive capability.

Yap, at that price, it should include the manual and software, correct?

>Total disaster.

Eee... it seems to run quite fine here on a Mega ST with TOS2.06, NVDI4.11.
Well, I have noticed a few bugs but overall, it works and is quite stable.

The main reason I switched to it from V0.94 is that V0.96 keeps posted
articles- which seemed to get lost occasionaly (it still seems to be
unresolved whether this is a fault of Newsie, the communication protocol,
or the ISP; I vote for protocol+ISP).

Btw. the bugs I noticed are:

* Trying to open "About NEWSie" meny item leads to a total freeze ONLY IF
registration data has been entered before (this one is old- it has been
so ever since I first started using Newsie- V90? I think...)

* Sometimes (rarely), when entring an editor (Everest) to to take a better
look at some article, after returning to Newsie, all previously open windows
become blank and it seems they can not be refreshed.

* If a name is deleted from the list of FTP servers, the next server
listed after the deleted name suddenly acquires directory info from
the deleted one.

Cu.

Depends on your definition of best. This can be
image quality, or how many pictures you can store
on the media (very few with 3.5" floppy), how
easily you can transfer them (very easy with 3.5"
floppy), or how quickly you can transmit them
(very quick with digital direct link).

On 3 Jul 2000 14:37:52 +, "Mark Bedingfield" wrote:
>I dont think that desktopper is avaliable any more. Do you know of anyone
>who has any? I am keen on getting one myself,

No, it's not available any more. It was OK as a cheap
solution, but of all the case upgrades I've seen,
the Desktopper is the most difficult to work with,
and is also not particularly sturdy.

I rate the the most popular Falcon cases as follows:

1. C-LAB MKX

Slim, stylish, superbly finished (no unsightly rivets,
and all the seams in the main top cover are smoothly
welded - think quality German domestic appliances) highly
accessible inside (due to the low profile), space for up
to 3.5" size HDD (AND a 2.5" if you're careful) and
internally mounted FDI. Gun-metal grey top section with
turquoise markings. Could pass for a Silicon Graphics box.
Needs slight metalwork modification to accommodate
CENTurbo II or AB40 boards. Easily done.

2. SoundPool 19" digital audio workstation rack

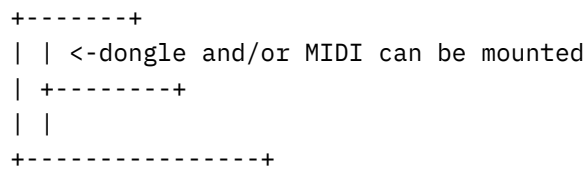
The most rugged (thicker gauge panels than most), very
well finished, dedicated tray for FDI and MO 4 to be
mounted internally. One front cut-out for FDD. Internal
media tray can accept 3.5" HDD, as well as a 2.5" drive,
if you drill some extra holes. It also comes with a
front-panel dongle port kit, which you may choose to use
or not. Houses CENTurbo II without any modification, and
you can even use the front panel switches for turbo on/off
(but you need to build an electronic latching circuit, too).

3. Lighthouse 19" Space Case rack (ST/E version also made)

Similar quality finish to SoundPool case (which is basically
designed and manufactured by Lighthouse, to SoundPool
specifications). The top-rear "dips" down like a step by
a few cm, which can be good or annoying. The dongle port
may be mounted in the vertical of this step (see below).
Some versions have a front panel with spaces for the
M/J ports. All have a 5-pin DIN connector space for
the keyboard (you can use AT-Key, or wire up the standard
Atari keyboard interface, which only uses four wires).
Internal media tray holds one FDD, and one HDD. Front

panel plastic blanking plates are flimsy and prone to
break and fall off. Pity. They also look really garish,
beige, in contrast to the black or grey of the casing
itself. Easily remedied with some spray paint (my friend
sprayed his silver; really posh). Not as good facilities
as the SoundPool rack, but a good budget-conscious
professional style rack.

Space case right-side view



4. Desktopper

Flimsy metal shell, doesn't totally re-case (only replaces
top half of original case, hence the name). Poor access to
the disk drives, almost impossible to route cables tidily
and optimise their length (do that and you'll end up pulling
them right out of their sockets every time you open the case)
A real pig to disassemble, not good for maintenance. Will
comfortably swallow a CENTurbo II with all the trimmings.

5. Wizztronics 19" rack

BIG Mutha. Has more ports than you can shake a stick at
(including space to mount decent RCA sockets for audio,
and 50-way Centronics style SCSI ports). Room for meaty
replacement power supply. Can mount CD-ROM drive internally.
Build and finish in the same class as Desktopper.

You can also get the Atari motherboards into an old PC-AT or XT case... the big desktops from the 086/286 era....
Pro:s....they are the case for what was a 2-3k computer and it shows...thick metal and lots of it they are built to withstand anti-tank weapons....they come with normally five 5.25" bays, two internal and three external, and a load of convenient ports already cut into th eback, plus if you use one of the grapohicvs cards based on a PC card (like the Eclipse my Falcon has) then you can put it on a PC expansion bracket at the back...

Cons:

They weigh lots, OK, it'll support a 21" monitor but it is still a heavy brute.....Lots of mods required, you have to gut out an old PC, nix the old PSU, plate over its mounts and fit a more modern PC-AT PSU, you lose some of the depth of one of the external 5.25's as well cos the Atari motherboard might interfere, and they need a repaint cos they invariably look grim....

It;''s a fun project, if you've got a spare 520 you can nick the motherboard from to use as a template then it's not too hard, and with the modern PSU mounted as high up the case as you can you can get the Atari in there in its shielding....

I probably should mention that when I tried the NNN thing, it was under Magic which has WDialog built-in as well as NVDI 5.03. I could access everything, but the address books or anything else in that section. Then the Hades060 crashed and I had to manually reset. The same thing happened when I booted without NVDI, so maybe it is a Magic thing.

From: Derryck Croker <derryck@NOSPAMcix.co.uk>
Message-ID: <962786292-528815AEicMi@cwcom.net>
Source record: 60131

From: "Marlin Bates, IV" <mcb242@psu.edu>
Date: Mon, 03 Jul 2000 14:43:48 GMT

>why am I not able to get the music on the STe, it seems like I should.
>OR, is that just it, I can not?

The STe doesn't have the necessary electronics to decode music that your CDROM device might be capable of sending down the SCSI cable. About the only way that you will be able to listen to music through the STe would be to somehow connect a lead from the headphone socket and mix it with the audio from the STe in the monitor port.

>There is a button on the accessory that says "record" so I am assuming
>that music can get in to the STe.

On suitable Ataris this is possible, for example the Falcon. Audio can be digitally extracted from the CD and be stored on disk.

144. Re: English version of Olga?

Newsgroup: comp.sys.atari.st
Date: 2000-07-04 00:00:00 UTC
From: Sean Barbieri <sean@barbieri.ukf.net>
Message-ID: <396239a4b0d850@barbieri.ukf.net>
Source record: 60132

Hi James,

From: jfhaslam@zetnet.co.uk (James F. Haslam)
Date: 02 Jul 2000 20:58:18 GMT

>Does anyone know where I can get the latest English version of Olga?

Worse comes to worse I can zip it over to you.

>>ie edit and save a HTML file, Cab should then redraw it, but doesn't.
>
As Derryck said it's probably the env and path issue - definately works
well here.

Environmental Variable: olgamanager = your olga application path

#_ENV OLGAMANAGER=C:\GEMSYS\GEMDESK\OLGA.APP

Here's my Olga.inf file for reference;

```
[Extensions]
.FLI=$ANIPLAY
.MPG=$ANIPLAY
.AVI=$ANIPLAY
.QT=$ANIPLAY
.MOV=$ANIPLAY
.HTM=$CAB
.TXT=$EVEREST
.ASC=$EVEREST
.AU=$GEMJING
.WAV=$GEMJING
.XRL=$XURL
[Objects]
.FLI=Autodesk Animator
.MPG=MPEG Video
.AVI=Video for Windows
.QT=Quicktime Movie (QT)
.MOV=Quicktime Movie (MOV)

[Types]
MV=$ANIPLAY
ED=$EVEREST
WP=$PAPYRUS
MU=$GEMJING

[Applications]
ANIPLAY=E:\PLAYERS\ANIPLAY\ANIPLAY.PRG
```

```
CAB=J:\CAB\CAB.APP
QED=F:\TEXT\QED\QED.APP
EVEREST=F:\TEXT\EVEREST\EVEREST.PRG
PAPYRUS=F:\PAPYRUS\PAPYRUSO.APP
GEMJING=J:\CAB\MODULES\GEMJING.PRG
XURL=J:\CAB\MODULES\XURL.PRG
IDEALIST=F:\PRINTING\IDEALIST\IDEALIST.PRG
AFTP=J:\AFTP\AFTP.PRG
JINNEE=C:\JINNEE\JINNEE.APP
UDO=F:\TEXT\UDO\UDO.APP

[Manager]
;NoCrashChecking
```

Incidently, anyone use the Olga Tools program at all? It works fine here for checking problems in the inf file but a lot of the options don't seem to be available (greyed out) ie. edit/copy/paste options etc. Is there something I've missed here or is it just that they are not implemented yet?

--

Please note I am in Italy, but I want to let the atarians know about the fact
I have some hardware to give away. I think you can read the italian ad,
please send offers by email and have a look at my home page.

- un AtariTT030 completo di tastiera e mouse, con 2MB STRAM + 4MB TTRAM
attualmente montato in un case Tower, o posso rimetterlo nel case originale
- un MegaSTE con 4MB di RAM completo di tastiera e mouse, eventualmente
montabile nel case Tower suddetto
- un monitor mono SM144 per il suddetto MSTE
- Il TT e il MegaSTE hanno montato l'ESCC per le seriali veloci
- Drive esterno Cumana con un drive floppy 3.5" e uno 5.25" switchabili A/B
- emulatore MSDOS Vortex AtOnce 386SX montato nel MegaSTE ma con confezione
originale
- emulatore SuperCharger1MB su porta ACSI DMA
- emulatore Macintosh Spectre GCR confezione originale
- scanner Manuale Alpha Data con Touch-Up confezione originale
- scheda Atari SCSI per MegaSTE per l'hard disk interno
- scheda SCSI per MegaSTE "Das Vorbild" che consente di collegare tutte le
unita' SCSI con software SCSITools, confezione originale
- vari software originali (Diamond Backup, Weks, Warp9, etc.)
- Drive rimovibile esterno SupraDrive removable da 44MB con 10 cartucce, si
collega alla ACSI DMA, dentro ha una schedina host adapter per il drive SCSI
interno, ed esternamente esce con una porta 25pin SCSI e selettore SCSI ID
- vari cavi e connettori per il collegamento ai monitor anche con switch a
multisync o SCART, cavi DMA, mouse di ricambio etc.

Sounds like a power supply problem or some other wearout mechanism.
There's not much point in trying to adjust the monitor to compensate for this,
you should get it repaired first, then think about altering the border size.

More than likely, if you try to adjust the border with the monitor in this
state, you might cause it to fail outright.

Also check the diode rectifier bridge at the output of that main
power transformer. Those are, I think, 200 volt parts on 20
volt service, and I had one fail, shorting the secondary of the
main power transformer, and burning out the primary, which is, as
I recall, 640 turns of number 28 wire.

If a diode is dead, check the primary resistance, end to end. If open,
maybe Best has a transformer. If not, learn to rewind transformers,
or get another monitor.

I have an Atari Mega ST4 system for sale. The machine includes
the "Rainbow" TOS ROMs. Other peripherals include a color monitor,
monochrome monitor, I.B. Drive 5 1/4" floppy and a 77 MB hard disk
(Berkeley Microsystems/Adaptec/Seagate) in a "side car" custom case. I
also have a good amount of software and a ton of blank floppy disks.

Anyone interested in all or part of the system, please contact me at
machiave@i-stat.com. All offers _plus_ shipping charges will be
considered.

From: CHMCAW@leeds.ac.uk
Message-ID: <2000Jul5.171703.12014@leeds.ac.uk>
Source record: 60051

I have an old but perfectly working SLM 804 printer and some spares for it. Gives decent 300 dpi printout. I rarely use it any more because I do most of my work on a Falcon now and the controller only works with ACSI (ST, STe, Megas) not SCSI.

How about

Printer 55 pounds
Spare toner (still in box) 15 pounds
New drum unit (in unopened box) 20 pounds

or all three for 80 pounds

The printer is heavy so postage may not be a reasonable option, but postage on the spares would be small. I'm in Leeds, West Yorkshire.

Hi, there!

There is a new Papyrus discussion forum at http://www.comm-talk.de/rom -
it is international, mixed English and German. Every English mail will
be answered in English, of course.

It is for all who are interested in the "Papyrus" wordprocessor,
database and office package, customers, interests, people who have
questions about Papyrus and those who want to discuss the further
development of Papyrus with the developers.

I will be there, frequently, for example, but it is NOT run by R.O.M.
itself, but by other people who make a forum portal at commTalk (Carsten
Mueller et. al.).

Greetings

Ulli Ramps

Nice idea but the RS232 port on a standard ST can only get up to
19.2kb. It would be a bit slow especialy with a few computers all
trying to access one computer.

I got as far as designing the pcb layouts for a twin serial port
expansion for the ST, but the chip used 85C30 is expensive (15
UKP)....

Interesting that this should come up now. I've recently started having
similar problems with CAF.

I have a 14meg Nemesis-enhanced Falcon with the FDI, and record to a
Seagate 4.29 gig SCSI drive (with 2 800MB partitions dedicated to audio).
I have used CAF for years without any major troubles. But after recently
switching to HD Driver from ICD Pro, I've started getting multiple bombs
(I think there were 8) whenever I try to record a _STEREO_ track.
I can record _MONO_ tracks ok though.

Switching back to ICD Pro ---> no more bombs.

One interesting thing to note, with the Nemesis turned OFF (using HD
Driver), I can record STEREO tracks probably 50% of the time. And for the
record, ICD Pro doesn't seem to care if the Nemesis is ON or OFF, it works
as it should.

The obvious solution is to go back to ICD Pro. But I've also got a PC now,
and I need to use HD driver so I can transfer audio files and such on
SyQuest cartridges between the 2 computers (using HD Driver's "TOS/DOS"
formatting option). Plus HD Driver is just plain faster than ICD Pro.

* The plus side of all this is that I was in the middle of a big project
where I needed record a lot of stereo AIF and WAV files from DAT masters,
and since CAF was giving me nothing but problems, I went looking for
another program to do the job, and came across "Sound Studio V2" by Studio
Capital/Centek. What a great digital recording app! Very impressive,
fast, and free! I've been using it extensively on this project without
any troubles. It's available on the Belgian FTP server.

Anyway, if anyone has any suggestions as to why CAF is having these troubles
when I'm running under HD Driver, I'd love to hear them.

I don't know about CD Recorder, but Anodyne Software's new "CD InScriptOr"
allows creation of ISO9660 CDs, with long file names, and can utilize the
joliet and rock ridge extensions. It works under ExtenDOS Gold, and is part
of the CD Writer Suite. I'm very happy with it.

Check out http://www.cyberus.ca/~anodyne/

Seeing as the original poster mentioned the RS-422, I would assume he
was talking about the Falcon or TT rather than the ST. These can
easily handle high-speed communications. I think that with these
newer machines (or with ST with upgraded serial ports), it would be a
cool thing!

It doesn't need decoding, but maybe byte-swapping (big/little
endian type stuff). It's uncompressed. In fact, an STE could
even play this audio, stripping down to 8-bit resolution
(very simple; just dropping a byte), albeit not at 44.1KHz
in hardware.

>>There is a button on the accessory that says "record" so I am assuming

You can do that on an ST/E/TT as well. Only the Falcon can play
the stuff real time in 16-bit 44.1KHz stereo. I know, I do it
all the time.

There is only information about designs that were
actually made (only one of which was intended for
commercial release and didn't make it), and
conditional proposals. Not vapourware. I know, I use
one of them every day and have seen many more of the
same in action. Its quality is of a very high standard.

I can also testify to having seen the actual work in
progress of RioRed. Nobody in their right mind sets
out to make vapourware. Atari got away with teasing
its users (intentionally or not) because it already
had an established product base with thousands of
fanatical users. It could afford to experiment with
things that might not ever be made commercially.
In today's Atari market, nobody can afford to do that.

I use my SLM 804 on my Falcon with a Heatseaker Interface. It replaces the
ACSI interface box and is connected to the DSP port. It works perfect and fast.
It comes with NVDI/GDOS driver and a rewritten Diablo Emulator. Could be very
interesting for you if you can find one for sale.

171. PhotoTIP for Digital Cameras

Newsgroup: comp.sys.atari.st
Date: 2000-07-05 00:00:00 UTC
From: ebaiz@skyenet.net
Message-ID: <9CO85.3022$%J6.8835@newsfeed.slurp.net>
Source record: 60065

Hello all,

There is a nice piece of software out for Atari computers called Phototip which I registered. It allows you to connect your Atari computer to a digital camera via the serial/modem port for d/l. It is compatible with a number of cameras which are listed on the webisite. My wife and I have decided to go with the SONY digital camera that makes the MPEG3 60 movies and has a higher rez than the other SONY camera. PhotoTIP still will work well with the camera eventhough it is not connected to my Hades. I just inserted the floppy and use it from there. Check out PhotTIP and d/l the unregistered version. It is well work the $32 I spent on it:

> John G.

I opted for that, but I registered a nice piece of software called PhotoTIP
which I can use with the SONY. It is compatible with alot of nice digital
camera that load through the serial/modem ports.

>Hello again,
>
>I will apologize in advance for all of my questions over the
next few
>days, months, years (!)
No need. That's part of what this forum is for. I agree that
you should study Nick's FAQ, though.

>Question one: How do I get on the net with the STe
1) Connect a modem to one of the serial ports (the modem port
is the most commonly used). I'm not really sure of the MegaSTEs
maximum speed. Most ST models top out at 19200, while the
Falcon and TT can in theory go to 115K or 230K (for some reason,
my Falcon is unreliable above 56K).
2) Make sure you have HSMODEM7 in the auto folder. HSMODEM7 is
a suite of programs, with strange names like SCC.PRG. You only
need the two or three applicable to your computer.
Unfortunately, I can't remember the exact setup from memory and
my Falcon is at home. FWIW, HSMODEM fixes some poor code in TOS
relating to modem speeds above 9600.
3) Set up and run STing. This is done by placing STING.PRG and
STING.INF in the auto folder (STINg.INF is an ASCII file telling
the computer where to find the rest of the STING package) and
SERIAL.CPX and STING.CPX in the CPX folder. The other two CPXs
are not needed. Upon running DIALER.PRG, you will be able to
tell STing about your ISP and configure it. (You can also hand
edit the ASCII files DEFAULT.CFG and DIAL.SCR, but you do not
have to). This can get a bit tricky, so feel free to ask for
help.
4) Finally, run CAB. You will need an overlay (CAB.OVL) from
Dan Ackerman's web site [is Oliver still updating his?]

Some things to note....

First, get HSMODEM running. It has to be before STing in the
auto folder since it configures the serial port!

Secondly, get STing running. STing has tools (like Ping) that
let you get the bugs out. Until STing is running smoothly,
there is no point in trying to run an application. Remember,
STing actually does the work of communicating over the internet,
even if it doesn't do anything with the data other than
transport it.

Finally, CAB (or any other STing compatible program) takes the data from STing and displays it. It then gives data back to STing for sending over the net. Worry about this last.

I know this sounds like a mess, but it really isn't that bad provided you take the time to read all the instructions and do one step at a time.

<atariactive@btinternet.com> wrote:

>
> Get a camera that can connect to a computer via Serial port, as I think
> the
> Atari programs only support that method of transport.

actually, since he has a Hades, there's another option that he has
open to him - SCSI. According to Dave Barkin, Microtek makes a PCMCIA
card reader device that hooks up via SCSI, and low and behold, an Atari
equipped with SCSI and HD Driver installed will recognize that device
and allow both reading AND writing to the card. Which means that it
opens up the number of cameras he can use.

I'm actually quite excited about digital cameras, and I'm now
noticing that the prices have been dropping very rapidly as of late - my
local Business Depot has new Kodak and HP cameras staring at $450 CDN .

Now I think one of the essential bits of kit that'll be needed for
the Milan II will be digital camera drivers....

Hi Ed,
I've opted for the Sony direct to disk only because I was'nt sure
of the compatability with PCM cards or direct connections to my Falcon!
(not much help for you there!). The memory cards should be faster
copying in the camera, hold more pics and there are floppy memory
card adapters for interface. But the direct to disk is stable and you'll
have that floppy as back-up if not erased (usable till the floppy dies!).

Hi Robert,

Try going to the "Atari Luanchpad". Address is:

http://www.geocities.com/SiliconValley/Bay/8745/index.html

In the search feature, type in "monitor", and it goes to a bunch
of monitor links. One of them tells how to fix a dead 124 mono
monitor. I know thats' not the same model as yours, but I would
think there is useful info there. It's a German ftp site, but the
text is in English. The Atari Launchpad is really a great site!!
Check it out. I believe they also have schematics of monitors
there.

Now _MY_ related question. One of my Atari friends has a 124 mono
monitor that has those wide borders that are getting worse and worse,
making the actual screen size ever smaller. I have heard there are a
few adjustments you can make to bring the screen back up to a more
usable size. What is it that you can do? Is there a web page that
deals with that? I've looked but not found one (yet).

Thanks,

Clayton Murray
Seattle, WA USA

I can't recall where this second fuse is. However, it could be that part of the power supply is being grounded. Look at the large electrolytic capacitors at the DC end of the power supply. If any show signs of leakage test and replace them.

There is PhotoTip. This program recognizes a few cameras (but
unfortunately not mine (yet)). It was translated, so there should be a
link on the TransAction pages: look at my sig. BTW, Altern is still down
:-(so you may look at my mirror site.

> There used to be a

I could have gone for that, but try to convince my wife. She wanted the
disk option, because (to her) it is easier. Speed is no big deal for me,
but it would have been nice. Maybe it will be an option in the future. I
did get a nice Sony camera though. It will do XGA and JPEG images along
with a 60 sec MPEG3 file with sound.

The Spectre 128 did not include the ROMS, but it could use the then new
128K ROMS, but it couldn't read/write Mac disks

> I think the Happy discovery cartridge docs did mention the 128.
> Incidentally, the happy discovery cartridge claims to be able to do the

The Happy IIRC was the first, and only supported the 64K ROMS.

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
find it hard to keep up with the NewsGroups.

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to bensmith@teleport.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

Hello again,

I just acquired a Translator One (the doohickey which would allow you to read/write Mac disks). Yes, I know, I realize that the GCR I am getting will obviate the need for this, but I like completeness :-)

So, any way, I need to know the specifications of the power supply of the translator so I can get a new one. Thanks in advance

-Marlin

> The more and more I like DOS the less and less I like windoze ;-)

I understand what you are all saying, but the original point of Donalds research (see original post)was that it was NOT a windows problem, but on what application is Installed that messed up the read/write function for a 720K disc format.So he advised to dis=install (if there is such a word!) untill you find the culprit, or just use SAFE-MODE when formatting discs. I suppose you could also go to the DOS window and use DOS to do the formatting as well.

This has mostly been happening to win98 users as I have had no problems with win 95.However it still comes down to an Application that does the messing up.

201. SpeedoGDOS problems

Newsgroup: comp.sys.atari.st
Date: 2000-07-06 00:00:00 UTC
From: jba4@po.cwru.edu
Message-ID: <3963fa47.20872803@news.cwru.edu>
Source record: 60072

Hey everyone! I am currently trying to configure SpeedoGDOS (version 4.x of some sort). I am using a graphing program that allows export to GEM format. I know I need to set up META.SYS in the ASSIGN.SYS file. I used the Speedo setup accesory to install META.SYS as device 31.

Now, when I export the graph (using FirstGraph), the file contains no picture. The file does have dimensions when viewed in other programs, but there's no picture.

Is there any trick to setting up META.SYS under SpeedoGDOS? Do I need to install some bitmap fonts under it in ASSIGN.SYS (all I have are Speedo fonts)? I'd really like to get this sorted out if anyone has any hints. tHanks in advance!

I have had a few drama's with ICD-HDdriver as well. If the drive was formated TOS compatible under HD Driver then had ICD or AHDI put on the drive then it caused the machine to lock up during some disk access's. Not consistantly though. So I wonder if your respective drives should be reformatted with HD Driver to cure the drama?

hi ed

i am not speaking from personal experience on the atari, but the best idea i
have heard is using a SCSI memory card reader. this way the digital images
appear on your desktop in a window like any other SCSI device(i.e.cd-rom),
and it is fast!!
we have one at work, and it is super, when(if) i ever have a digital camera,
that would the route for me. trouble is,i don't know how much they cost.
the SCSI reader and memory cards together could get quite expensive though.

Hi Ed,
Out of curiosity, which model Sony did yoy get? Mine (FD88)
is strictly direct to floppy. Had I been aware of the software you
mentioned, I might have sprung for the higher priced model! I believe
it was'nt available at the time I purchased the camera anyway.
I'm very happy with this one and it's features but it must be nice
to dump a file faster.

>Do you know if this interface works with a SLM 605 as well ?

I don't know for sure, but I'd expect that it would. The original controller unit is exactly the same as the one used for the 804, and all the software that works with the 804 works exactly the same on the 605.

The possible fly in the ointment is that the Heatseeker has special printer drivers, which might mean that some software gets left out in the cold.

Yep, that's correct. Can you try and pin the problem down, perhaps there's some sort of bug in FirstGraph that prevents it from generating a gem file properly?

You don't need any fonts for the meta.sys device.

Well, I always use Everest rather than QED so just kept this in there as
an option - I did want to have both of them use the TXT extension but this
brings up an error in "tools".

As for the others, as far as I'm aware (maybe wrong here though) I don't
need to have extensions/file types because the applications are "Clients"
not "Servers" - is this incorrect then?. Do you have entries for Idealist,
Jinnee etc then Derryck?

I looked around a bit and it appears that the MegaSTEs LAN port
can handle 115K/230K speeds. You just need a Macintosh 8 pin
adapter for your modem.

Source record: 60095

I had such a box once here. It did not work on a SLM 804 because
there are two diffrent interfaces for that printer. This is not well-
know. I has to do with a Canon or a TEC drive inside.

I seem to remember that the makers had different software for both
and later (after my complaint) very soon an extra SLM 804 driver for
the canon-version.

Met vriendelijke groet,
Ronald van der Kamp

I found a review of the Heatseeker in the German magazine STComputer 7/8/1994. It is compatible with the 605 and 804. It says that there should be drivers for Calamus S and SL, That's Write , Wordplus and Composcript besides the GDOS and Diablo driver. And it should also be possible to use Ghostscript. I can tell you it works, I have a good working Ghostscript with use of the Diablo driver. On my disk there are no Calamus and Composcript drivers. I use the printer most with Atari Works (NVDI4+GDOS driver SLM-HS.SYS) and Publishing Partner Master (=Pagestream). You don't need to have the printer on when booting the Falcon. You can switch it on when you need to print (have you ever heard the noise of a SLM804...). The memory usage is very low and it works faster than on a ST or TT. The interface was made by R.O.M. Logicware Raschdorffstrasse 99 13409 Berlin. Price was 199,- DM.

Hi!

I know this is a bit of topic but it is to do with making an Atari HD module. The main reason why I'm posting here is because:

1) The electronics newsgroups are too over crowded. (Some get 200+ posts a day!)

2) I know you guys. (or do I.....)

Anyway the question is:

Does any one know where to get 16mhz TTL Oscilators from preferably here in the UK. These are the ones with a DIL 14 pin layout (only 4 pins sticking out) in a silver tin case.

I designed the boards and then rang up Maplin to order the parts but they have discontinued the 16 mhz part. Ahhh!
Rapid or RS Components don't sell them so I'm a bit stuck. There aren't any Electronics shops around for miles (the nearest one is more like an antique shop!).

Thanks for any help.

My Atari was stolen a few years ago. I still have diskettes
full of MIDI files, though, and would like to get them on to a
PC.

Problem is, these diskettes were never formatted in the way that
allows PCs to read them...and I don't have the Atari ST to be
able to transfer them to a diskette that CAN be read on a PC...

Anyone have a solution? I would greatly appreciate it!!!!

Greetings Atari Folks....

Could use some info on updating to the latest version of STinG.

I see that there has been a new release, Version 1.26!

According to the STinG DIALER.APP I have the following versions...
Dialer Version = 01.16
STinG Version = 01.20

First, I would like to update to the latest version before the release of 1.26. Then I would like to upgrade to the new 1.26 version if it is bug free.

Now when updating, do I have to install the complete latest version or can I just copy the updated files over into my current working STing setup?

If I just need to replace a few files, which ones do I need to install to have the latest version before the release of 1.26?

And are there any known bugs or problems with the version of STinG before the release of the new 1.26 version?

The version I am running now on my CT2B Falcon works fine, but if there are improvements with the latest updates then I'd like to try them out.

If you post a reply, also email me a copy as well.

Thanks in advance for any help,
phantomm@eastky.net

You can pick up 16MHz from the (I think) SCU. Alternatively,
buy a faster one and use a divider (sure, extra cost). Maybe
even multiply the existing clock.

Have you tried ordering on-line from Farnell?

www.nvdi.de

Free fresh-up to 5.03. However, 5.03 (unlike 5.02) will NOT
work properly on CT2 unless you have CENTScreen installed
as well. Otherwise you get GEM with text but no icons.
Weird.

238. Currently available printers

Newsgroup: comp.sys.atari.st
Date: 2000-07-07 00:00:00 UTC
From: atarigalen <kNOkSPAM@uia.net.invalid>
Message-ID: <00e4fd20.53ba67d2@usw-ex0108-063.remarq.com>
Source record: 60021

I'm wondering what currently available printers work with NVDI 5. Note that I'm not asking what printers work with NVDI -- that's on their webpage. Unfortunately, most of the printers there are no longer made. To get the discussion rolling:

The Epson 740, 850, and 900 use ESC/P2 language, which NDVI supports. Unfortunately, the 740 is the only one of these still available, and it is being discontinued this year. The Epson 740i, 760, and 860 use ESC/Raster, which is not the same thing as ESC/P2. On Epson's web site, they mention how to drive the 740, 850, and 900 with DOS, but do not consider the newer printers to be DOS capable, leading me to wonder if the new Epsons can be used with NDVI.

Pretty much any HP Deskjet made speaks HPL3, so 600 dpi black can be obtained easily enough. Most HP printers understand earlier versions of their languages (bless HP for this), so I suspect (but do not know for sure) that 300 dpi color is obtainable from some models. What currently available HP printer can do 600 dpi color using NVDI, if any?

Both the Brother laser and the HP lasers speak some superset of HPL3, so again, 600 dpi black should be easy enough.

I fear that the soon to be discontinued Epson 740 is the only printer now in stores that can provide good color printing with NVDI. I would love to be proved wrong on this.

To the best of my knowledge, 1.26 is the version that supercedes
1.20. I do not think 1.21-1.25 were ever publicly available.

As for the rest of your questions, STing 1.26 has been available
for only one day, so no one knows the answers to them yet.
Download the package, read the instructions, try it out
yourself, and then answer your own questions here. Others (such
as myself) would be very interested in knowing them too.

242. Papyrus 8 demo and SLM 804

Newsgroup: comp.sys.atari.st
Date: 2000-07-07 00:00:00 UTC
From: Ken Springer <wordworks@greeleynet.com>
Message-ID: <396679FF.889FF74C@greeleynet.com>
Source record: 60025

Ulli,

I just tried the TOS demo on my TT030. I have some forms I've created for work. There are a number of table cells that have 50% gray fill. When printed on an HP LJ4, Windows version Pap 8 demo, the gray fills are stunning. Excellent. But... When printed to the SLM 804, they are horrible. The same look is in Papyrus 5.15.

Based on Calamus experience, I'd say the built in line screen is too high for 300 dpi printing. I printed a 50% gray fill from Calamus with a 28 lpcm setting, and the SLM worked wonderfully. It's what I expected to see from Version 8 of Papyrus.

I created some forms with these fills to present to customers. With the output as it is now, I can't do that. I would be ashamed to present this printed output and claim to be meticulous in my work at the same time.

Changing to a fill pattern does not seem to work either.

Is there anything we can do to fix this?

Has anyone else noticed this on any other 300 dpi printer?

Thanks.

Have you changed links to suit the new location? Whilst I only had a bried
look, the first link I clicked on resulted in a file not found.

No, I don't. I couldn't see anything in the docs for the respective apps that
suggested that they supported Olga, so ...

I'm not expert at this, so maybe I'm wrong! :-)

You can "Olganise" apps with the "Olganiser" or whatever it's called?

>4 pins sticking out) in a silver tin case.

Ive found some listed here in the CPC catalogue, but in an 8 pin DIL
layout, 16MHz Part no. SCC1200C15, ï¿½1.99.

But you'd need a trade account to get one!.

>as myself) would be very interested in knowing them too.

The following URL to get the new STING & Dialer and how I updated.

http://www.ettnet.se/~dlanor/sting/html/sting.htm

I made copies of the old STING (Auto folder), TCP.STX, UDP.STX,
DIALER.APP, SERIAL.CPX, STING(Internals).CPX, STINGPORT.CPX,
STINGROT.CPX. Then replace these files with the new ones and in
a folder put the rest of the rest of the Modules with A STY ext.
and not needed unless you are networking with other computers an
if you need them change the the ext to STX. BTW copy down the
settings of your SERIAL.CPX and STING internals and reconfigure.

Hope this helps, BTY Dialer can once again be used as an .ACC.

248. Problem MP3 Files with Aniplayer

Newsgroup: comp.sys.atari.st
Date: 2000-07-08 00:00:00 UTC
From: nurmix@socal.SPAM
Message-ID: <8k7q0g01srh@enews3.newsguy.com>
Source record: 59948

I recently mentioned having trouble with some MP3 files with Aniplayer.
Anyway, I talked to Didier about it, and sent him a couple that were not
working correctly with Aniplayer (although they did work with FALCAMP and
several PC players). Apparently it was some weird information in the
headers (probably put there by MP3.COM - which is where I obtained the MP3s).

Anyway, he's modified Aniplayer to ignore the weird ASCII data in the
headers, which has solved the problem.

You and me both. Actually, I asked John for this a long time ago, but he
didn't seem to think there was any demand for it, aside from my request.
Well, John, now 2 people want it! <ha ha!>

>BTW: can I use news servers that need name and password with newsie?

Ah yes, I ran into this back when I first started using NEWSie (like 2-3
years ago??). Anyway, my ISP's news server requires a _global_ user name
and password (it's the same for all users). You send the information they
give you to use, and if you've sent the right information, the server checks
that you are connecting from a valid IP address (to prove you're connecting
from the ISP that uses that login information), and if that's correct,
you're in.

Basically in NEWSie, simply create another user profile (I named mine after
the news server - "newsguy.inf"), and under PERSONAL INFORMATION, put the
user name the news server requires under E-MAIL ADDRESS. And under MAIL
READING OPTIONS, put the password the news server requires. It should work
fine after that. Just switch to that profile whenever you're going to
connect to the news server.

252. Atari ST Questions / Hopes / Dreams...

Newsgroup: comp.sys.atari.st
Date: 2000-07-08 00:00:00 UTC
From: swallow@intergate.bc.ca
Message-ID: <3967b672.10193157@news.intergate.bc.ca>
Source record: 59952

Hi all.

I have some questions for you about my ST.

1) Can I connect my ST to my PC and have it transfer files? Perhaps a Direct Cable Connection with a x-over cable?

2) Can I network the ST through Ethernet? Perhaps to share an internet connection, etc.

3) How do I get my PC to write ST compatible disks? This is the question I really need to get resoled. There is a whole bunch of software on my PC that is meant for the ST, but it must stay there as the two aren't talking to each other at the moment. Suggestions? Is there a program that will cause the PC to write ST compatible disks?

Anyways, if anyone has any help for me, email me at swallow@intergate.bc.ca (I don't check my yahoo account that much... :)), or post a reply here. Thanks in advance.

Another nice feature is the @ sign next to a file with an attachment.
I've un-checked the 'Auto Extract' box in the event there's a massive
EXE file or even a virus lurking so the "@" sign at least warns of
something there and if it's from someone I don't know (or someone who
I do know that refuses to heed) I can delete it without opening!
Good show John!

As I stated, I believe its more relating to WDialog 2.0 and higher
usage of Address Register 4 (a4), which Lattice C uses for 'near'
variables. Somehow Wdialog 2.0 and higher appears to corrupt this
address register, which causes NEWSie to have problems internally.
Not because of what NEWSie is doing, but because of what Lattice is
depending upon.

Well, that won't help much, as 68030 are basically the same regarding the
instructions set. You'd better ask for a better compiler optimisation switch
(e.g. -O<n> on gcc) as I guess Nview is entirely coded in C (what allows so
many simultaneous ports).
BTW the author answered me that he has _not_ given up Atari support!

Hi!

>You can pick up 16MHz from the (I think) SCU.

You can get 16mhz from the shifter on both the ST and STE but I tried it using the signal from an STE and it didn't work. I tried it on an STFM and it worked fine. I've tried this on 3 STEs now all different revisions and all didn't work well.

>Alternatively,
>buy a faster one and use a divider (sure, extra cost). Maybe
>even multiply the existing clock.

I have already got 28 boards etched so I don't want to have to change them.

>Have you tried ordering on-line from Farnell?

No, I think I've heard of them before. I'll search about on the web...

>Not even RS? I can't believe that...

Well OK I have been looking in a very old 1995 catalogue. They do sell 16mhz TTL osc. but they have the 8 pin layout. Their website doesn't display at all on my ST. I might ring them up....

Thanks for the help Shiuming

I have a 2080STe and a PC. I am interested in networking the two machines so as I can use the PC as a file server as I don't have a hard drive for my STe.

Has anyone got any suggestions as to how I can go about this relatively inexpensively. I can lay my hands on a LAN card for my PC, what would I need on the other end.

Anyone considering the purchase of a Sony peripheral for their computer
might want to give it some further thought. There clearly is not a
reciprocal relationship between what they sell and what they service.
-
I purchased a CD-RW drive back in April that just recently went bad
(won't read). When I called Sony service, I was told that I could not
get a replacement and that I had to ship it across the country to be
"repaired" (and we all know what that means...) - with a three (3) week
turnaround. Assuming that they keep their 3-week commitment, with
shipping both ways, I'd be without the use of the unit for at least
five weeks!!!
-
I hardly think that's reasonable or fair.
-
Compare this to HP, who under the same circumstances would simply ship
you out a replacement unit and issue a call-tag for the old one.
-
Sony is a behemoth in the marketplace and as such, they have an
obligation to scale their service facilities to meet demand. To not do
so is an indication of their lack of commitment to customer satisfaction
and an unwillingness to stand behind their products.
-

Just open a DOS box and type
format a: /f:720

You can add an /u switch for an unconditional format, although that usually
isn't neccesary if you are formatting DD disks. (HD disks shouldn't be
formatted as DD, and vice versa, as that is unreliable)

: Does any one know where to get 16mhz TTL Oscilators from preferably
: here in the UK. These are the ones with a DIL 14 pin layout (only
: 4 pins sticking out) in a silver tin case.

Perhaps Newark Electronics has an English presence. They have almost
everything, at prices not too far out of line. I forget the web address,
but it should be easy to find.

I know they do not have hesitation switches (what?) because I bought
their last two, but they had them when I needed one.

By the way, the machine that is typing this, an STe has one of those
boards, built by someone else, and has a switch on the back because the
drive I used did not have a large enough voltage swing from the hole
detect switch, which were processed by the main processor chip, and
seemed to be appropriate for 3 volt logic. Easy for me, but then I
have four scopes I can see from here.

One solution is a book on DOS, which may help with Windoze 9X, which runs on an emulation of DOS. If you know the format, you can set up a virtual drive in DOS which reads the format you have.

If you cannot find one, you might post to the group or e-mail me. Right now, I am home, which is 432 US miles from where I work, and that book is at work.

288. Atari SC1224 JVC Monitor low sound volume??

Newsgroup: comp.sys.atari.st
Date: 2000-07-09 00:00:00 UTC
From: Tim <tjlazer@my-deja.com>
Message-ID: <8k9b3ngim1@nnrp1.deja.com>
Source record: 59967

Hi, I just got an Atari SC1224 Version 2 JVC Color Monitor. I had to buy a seperate ST monitor cable to get it to hook up to my 1040ST as this monitor type does not have the cable built in like the other one!

Anyway the sound volume is very low compared to my other SC1224 standard monitor! With the control all the way up the sound is barely loud enough to listen to! I opened the monitor up to see if anything looked funny but all looks good.

Any ideas? What should I look for? Any way to increase the volume level?

Thanks

Tim

Hi

It could be a few things:

Some of the disks have gone bad, they have bad sectors/tracks on.
Some of the chips may need reseating in the machine.

Hi

If you have a hi res monitor and are using a switch box to change
between the 2; some switch boxes DO NOT switch the sound off/on between
monitors, so you have sound going to both the monitors and very low
sound.

I came across this problem myself. Just thought I'd mention it just in
case you are using 2 monitors:)

>Direct Cable Connection with a x-over cable?
Hi

Yes you can connect the ST and pc together via a null modem and then you could use a terminal program to talk to each other. But this is VERY slow.

You can also use Ghostlink or one that uses a parallel connection (can't remember the name off hang, well I did 2 seconds ago!!).

>
>2) Can I network the ST through Ethernet? Perhaps to share an
>internet connection, etc.

Apparently it should be possible, but I've not done it yet. Mario Becroft is working on a project at the mo though:)

>
>3) How do I get my PC to write ST compatible disks? This is the
>question I really need to get resoled. There is a whole bunch of
>software on my PC that is meant for the ST, but it must stay there as
>the two aren't talking to each other at the moment. Suggestions? Is
>there a program that will cause the PC to write ST compatible disks?
>

Yep this is dead easy to do:)

The first thing I must mention as this is VERY important for the safety of your data: USE ONLY DOUBLE DENSITY DISKS (DD, 720k) unless you have had a high density drive fitted.

You ST will read a disk formatted via your pc, BUT there are programs that can format the disk and stick the relevant MS-DOS stuff on the disk with the ST.

What's more you can also take advantage of EXTENDED formatting, other than the standard 9 sectors per track and 80 tracks, with the ST.

I use DC Format 3, which I do have on my web site:

www.steverosie.demon.co.uk/programs/dcform3.zip

It's quicker to transfer via floppy if you can, rather than using
Ghostlink.

>Anyways, if anyone has any help for me, email me at
>swallow@intergate.bc.ca (I don't check my yahoo account that much...
>:)), or post a reply here. Thanks in advance.

Erm! Sorry chap but when you request these things via a newsgroup you
the replies will be via newsgroup and not via email! Netiquette...

I'm getting it from Farnell now, but thanks.

>The drive I used did not have a large enough voltage swing from the hole
>detect switch, which were processed by the main processor chip, and
>seemed to be appropriate for 3 volt logic.

Looks like the drive was using the 3.3v type of chips. Use a
transistor like a BC109/108 (can't remember but it needs to be a NPN)
and take the output from the floppy drive through a 4.7K resistor to
the base of the transistor. Connect emiter to ground and the collector
to 5v positive through a 4.7K resistor. Now connect the wire from the
processor board inbetween the collector and resistor.

Little picture:
4k7
|---/\/\-----+5v
|
|--------to processor board
from 4k7 b /c
FDD -/\/\----|
\e
GND |
****

When 0V is appplied the transistor will have a high resistance so 5v
will go to the board but when 3.3v is applied the transistor will have
a low resistance pulling the output low.

I hope that helps you. BTW I have a digital handheld scope ;-)

I was wondering where it was avaliable from apart from the ftp site
chaplie. Hopefully this version will work on my ST. I tried so hard
to get 1.22 working. I'll download it today.

I can't wait to get on to the chaplie ftp!

I suggest taking the ST apart down to the motherboard, but keep a note where the screws go. Apply a bit of force to each of the socketed chips and use a soft brush to clean the board of dust.

If you're a bit worried of removing the cover from the floppy drive to clean it just blow the dust out out of the floppy drive.

Power it up without the top on, just DON'T go near the power supply. Check it out and if it doesn't work then try cleaning all the contacts with white spirit.

I don't like doing the 4 inch drop. It can work though but I would be worried of knocking the floppy drive heads out of alignment.

>loud enough to listen to!

There may have been some resistors fitted in the ST monitor plug, if
there are you could experiment with their value, i'd go down to 470ohm
myself, no lower.

Hello to yet another american whinger.

>Sony is a behemoth in the marketplace and as such, they have an
>obligation to scale their service facilities to meet demand.

Jesus, do you have any idea of the size of Sony Corp. service organization!!,
obviously not i'd say!!.

On the subject of obligation, a most important obligation is one of price, what you
are asking for would shove the price into the unrealistic bracket, you have to pay
for unconditional replacement schemes, big wonga prices, get your head out of your
arse.

>To not do so is an indication of their lack of commitment to customer satisfaction
>and an unwillingness to stand behind their products.

It sounds to me like they are very willing to repair their product, the 3 week
quoted is also realistic, the middle week of that is probably burn-in testing.

The "Ultimate Virus Killer 2000" is the industry standard virus killer for the Atari ST/TT/Falcon platform. The program has been around for well over a decade, and with the latest release (8.1) it's turned shareware.
There is now an official "UVK 2000" support site where you can download the program, find descriptions of all Atari TOS-platform computer viruses (and their symptoms) and more. It's located at http://www.uvk2000.com (this is a new URL!).
This message is being sent to three newsgroups. If you think this constitutes spam, or if you think this message does not belong in your particular newsgroup, please contact me at cronos@atari.org and I will refrain from posting to the newgroup in the future.
Thanks for your time.

301. ST News International Christmas Coding Convention 2000 (Atari scene reunion event)

Are you a member of the former Atari 'scene'? Did you, perchance, visit the "ST News International Christmas Coding Convention", in Oss, Netherlands, December 1990?

Then you should not wait a second longer and surf over to http://www.stniccc.com (which is a new URL!) to discover that, in fact, a reunion of that very historical event is being organised for December 2000, a 10th anniversary reunion as it were! It is going to be the coolest event of the millenium, I can assure you!
In case you've already surfed over to that site in the past year or so, be advised to check it out again, as it's been overhauled utterly! It looks way cooler now, and contains a lot more information!

In the Configs section of the dialer, (under Miscellaneous, I think)
do you have it set to stay resident? If this box is marked, the
dialer will stay resident after you close it, allowing you call it at
any time from a task manager (like APPLINE in Magic, or Task Manager
ACC in Geneva).

OK, if you get *really* stuck, we'll lay a cable from my house
to yours, and you can pick up 16MHz from my Falcon ;-)

If it turns out that 16MHz crystals are no longer available,
we could set up a wide area 16MHz clock signal distributor
and charge by the second...

>>Have you tried ordering on-line from Farnell?

Farnell is more professionally oriented than Maplin. I don't think
they even have retail outlets. Hence, their catalogue is free (order
it from the web). Maplin only puts a price on its catalogue for
protection (otherwise people would take loads).

It is simply a very bad idee. It makes mixed language or even mixed compiler programs very difficult, if not impossible.

It belongs to the many temptations that assembly programmers have to withstand. :-)

Hi John,
Just thought I'd mention I'm using Wdialog 2.04, NVDI 5.01
and there are no crashes with Newsie .96 however there are no extra
fonts loaded either! So I assume Wdialog only comes into play with
fonts (and the NVDI printer cpx).

Well if you can get a ST emulator for the PC that could access the MIDI
ports of the PC (am not sure if Pacifist does) there is a program I have
that will do this. I tried it out with my Hades hooked up to my STe
through the MIDI ports. I was able to bring up the files that were on my
STe on the Hades. I could then click on the programs that were on my STe's
hard drive and they would come up on my Hades. Kind of neat.

Any fellow ST'ers out there willing to donate PD games
to my site?

The Site consists of Classic Game Remakes, You know
like Space Invaders, Asteroids, even computer
remakes like ZX Speccy's Jet Set Willy and Atari XL's
Attack of the Mutant Camels....

The remakes on my site are for the moment downloadable
for the Amiga, IBM PC, and Atari ST. Tho' other platforms
will be catered for in the future.

If you would like to donate software please mail me below
with a) The Original Games Name and b) The Remakes
Games Name... software will be added as and when I get
it...

Regards

In my opinion very god worksheet is "Opus".
Many options, friendly for user, export/import to .wks (Lotus 1-2-3
worksheet).
It work in hi res. Made in 1990

Well it's a after market plug 13 pins and there seems to be no
resistors on the ends! I am not sure if I may need a better cable!

This is an odd problem I prefer the JVC monitor over the Goldstar one!

>Damm!

On a different note, why not consider dividing down the master osiullator (32 MHz, or there abouts). A simple TTL divider chip is cheaper than an oscillator & can give you multiple outputs at different frequencies.

It can sometimes be an advantage to have the 16 MHz output phase locked to the master oscillator.

Look for something that operates up to 60 Mhz or higher.

** Stuff deleted about Hades networking **

You can use the PC's serial port if you set it up as an NFS server.
I did this & it worked, but you need to run MiNT on the STE, & 2 MB is
probably not enough for all of the networking stuff.

The speed was 19,200, really kind of slow.

The other posters idea about Pacifist is quite good, but if Pacifist does not
support the Midi port (this on the soundcard, right?), there might be other
emulators (TOSbox, WinSTon, etc) that might.

If none of then do, then you might consider buying a cheap ISA PC serial card
& changing the crystal frequency to convert the 38,400 baud output to 31,250
Midi frequency, then set this card us as the main serial port.

John Garone a ï¿½crit :
> I know "0" about programming so I could'nt make any suggestions there.
I just wanted to point that a 030-version instead of a 020 one would be unuseful. So I suggested him to try to fiddle with his C compiler's optimisation options (in case he hasn't yet done so).

> Good to hear he's still backing Atari though!!! Can he get it to laod
> a pic as fast as the Apex viewers do (without loss in quality)?
Well, do you think/feel the Apex viewers loose quality :) ? Well, perhaps if you have a graphic card installed (sadly it think they lack Eclipse support :(...), you could have a better result on screen... And Apex viewers could be even faster if they did not pay attention to better-than-standard quality (AFAIK they have some tricky display routines to do more that Falcon standard 64k-colors and 256k-color palette).
Anyway portable C cannot be faster than assembler IMHO... So only use Nview for exotic formats and the new formats we (yet) have no dedicated viewer for, like PNG or PSD.

Message-ID: <zMka5.1894$V12.51735@weber.videotron.net>
Source record: 59912

Newsie seems a bit more stable than before but there's still a number of problems:

When retrieving mail Newsie doesn't recognize the end of an email and will sit waiting for the timeout. If I press escape I will lose the current email (about 4 lost this way). I've worked around this by setting the timeout to 5 seconds, but really this seems to be a major bug and I remember this from previous versions.

When saving preferences and other options the file select box appears with lower case letters.

There doesn't seem to be any (easy) way to edit a newsgroup article before sending it. I'm doing it now but I had to manually load the article.

I won't carp. Basically it works, but it's a bit awkward. Thank you John for all your hard work. If you could fix the email bug I would be happy.

Hi!

A few months back I was having trouble with sting 1.22. Guess what...
I'm having trouble with 1.26!.

I tried reindstalling 1.22 twenty odd times. From floppy using a
minimal system (HSMODEM7 STinG Xcontrol) tried TOS 2.06 and 1.62.
Tried using cops and Zcontrol.

Everytime I loaded a programme it would lock up either from Hard disk
or floppy.

Sting 1.26 does exactly the same on my STe!

So I tried it on another computer. The other computer was an STe with
external blitter chip like just like mine.
It worked fine!

The only thing it could be is:

1) 4mb of RAM (yeah right this is causing a problem)

2) TUS developments tos switcher (tried it in 1.62 and 2.06, so it
can't be that)

3) TUS IDE interface. I think this is the problem. I've never had
any trouble before, but it can't be anything else.

Anyone had any problems with it?

The English translation of PhotoTip can be downloaded from the authors
website. PhotoTip comes bundled with the English RSC and bubblehelpfile,
the English help hyp file is nearly ready and will be added to the package
later this month. Registered users will recieve a printed English manual.
English translation of Phototip by DDP <sic>.

PhotoTip 2.11 : http://dursoft.atari-computer.de

Cheers from Belgium
Dennis

341. Re: Digital Camera: Cable or disk

Newsgroup: comp.sys.atari.st
Date: 2000-07-10 00:00:00 UTC
From: Dennis Vermeire <dennis.vermeire@yucom.be>
Message-ID: <963252848-329235AEicMi@yucom.be>
Source record: 59921

>On 4 Jul 2000 13:34:13 G, Edward S. Baiz Jr. wrote:

>
>>I was just wondering and would like an opinion. Which is the best kind or
>>digital camera, the one that puts the pictures on a 3.5 inch disk or else
>>the ones that have a cable and need to be hooked up to the computer so
>>that images can be transfered?
Just adding my two cents...
The Sony Mavica models save the pictures on disk, the advantage of this is
that you don't need cables or expensive ramcards, an inexpensive disk will
do. The drawback of this kind of cameras is that they are clumsy, heavy and
there's no way to take for example pictures at high speed, it will take at
least a couple of seconds before the picture is saved to the disk, and the
camera is ready for the next shot. Because of the space limitations you'll
need to carry a whole lot of disks with you...
Another disadvantage is the price, for the same amount of money you can buy
a digital camera with a CCD containing over two Megapixels, this will
produce pictures with a resolution in the range of 1600*1200. The latest
generation of digtital cameras now come with CCD's containing well over 3
Megapixels giving a resolution of 2048*1536, a picture that size would barely
fit on a diskette even if it's compressed with JPEG on a very high setting...
The price of these cameras keeps falling every month, if you don't really
need one today, I think it would be very worthwile to hold on for a couple
of more months, the picture quality of these new 3 Megapixels cameras is
just as good as from the tradional APS cameras, If you want SLR quality
you'll have to wait a long time, these cameras still cost more then an
average car...

PhotoTip doesn't support a lot of brands, but the few cameras that are
supported are among the best.... Olympus, Nikon, Epson... etc..
As an Atari user you should look for a camera that has a RS232 port, a lot of
new models now only come fitted with a USB interface. If you can afford it buy

a camera with a *real* zoomlens, some of the cheaper models offer a zoommode
but this is a fake, they enlarge a portion of the picture which ultimately
stands for loss of quality. The traditional camera makers put a good type
of quality lens on the camera, some cheaper models seem to be using the
backend of a beerbottle.

Have you considered the alternative route?
The latest batch of affordable scanners can scan pictures and slides at a
quality that none of the above mentioned cameras are capable off. The Epson
1200 Photo scanner and an average SLR will cost less then a digital camera,
and it's going to take a long time before that kind of picture quality is
reached by any (affordable) digital camera.

Cheers from Belgium
Dennis

PS: Next month Sony will release the Mavica MVC CD1000 that instead of a diskdrive comes with a compact internal multisession capable CD Writer, the camera can write up to 156MB on a compact CD, the CD can be read with a normal ISO 9660 driver in a standard CD-R. For the first time Sony implements a 2.1 Megapixel CCD in a Mavica model, which can produce pictures up to 1680*1240 pixels and it has a "real" 40-400mm zoom.

Does anyone know where I could find this module. I know it exists,
but no one sells it anymore. The only place I can find it is on
Steinberg's FTP, but it is an update and you need the original disk to
make it work.

Thanks in advance

DobDoa

What exactly is a Falcon? An Atari computer that was released after the ST?
I tried looking for websites that had just basic information (specs,
history, pictures) and couldn't find any. Does any one know a good site for
me to look?

I've just been given a 1040STF with no mouse, no manual and no idea how to use it. I would specifically like to use it to operate a music sequencer such as Cubase. Can I navigate the desktop using only the keyboard? How do I find out if there is enough memory for sequencing? How does it interface with studio hardware? etc etc etc Any help or advice would be greatly appreciated . . .really!

Sure. It will work on any atari computer with a DMA port. If it is not bootable, you will need some kind of HD utilities. Atari's original AHDI or Uwe's HD Driver, or something in between!

Opus is freely distributable, if I remember correctly. Texel is
most certainly commercial.

John,
The 020 and 030 chips are so similar that you wouldn't be likely to see much difference in a recompiling of the source. I have no idea what Nview does (yet), but I'd be perfectly content with an actively worked on 020 version.

>
Here's some of the info I used when setting the Olga.inf file:

[Jinnee]
If OLGA is installed, under a multitasking OS, the application called
when clicking on the Editor button in the Notepad dialog is determined
by the file extender entered into this editable field. Only extenders
listed in the OLGA.INF file can be recognised.

[Idealist]
If you have installed OLGA to use object linking between aplications,
IdeaList works as an OLGA Client. You can edit text files and .IXA files
with any editor supporting OLGA, such as qed 3.90. IdeaList will reload
immediately the corresponding file when it is has been saved by the editor.

* reading this again maybe I have to set Everest to read the .IXA
extension?

>I'm not expert at this, so maybe I'm wrong! :-)
>
I'll have to ask Steve then! ;)

>You can "Olganise" apps with the "Olganiser" or whatever it's called?

If you "queue" the article before sending, you can highlight it in the "postbox" then <shift><return> will open it in the editor.

Save changes, and the new version can be read/checked via the postbox before sending. Ideal to avoid the occasional smelling pistake :-))))

360. Newsie - <no subject> messages

Newsgroup: comp.sys.atari.st
Date: 2000-07-10 00:00:00 UTC
From: paul.williamson@zetnet.co.uk
Message-ID: <396a45ed$0$31674@news.zetnet.co.uk>
Source record: 59940

Hi All,

Over the last few months several of us using zetnet (UK ISP) have been trying to work out why we sometimes get <no subject> messages when downloading newsgroup articles for offline reading.

The problem seems to have been narrowed down (by David Henderson) to the way Newsie handles unallocated X-ref numbers. It seems that these occur at times for a variety of reasons, maybe a message has been cancelled or something, and Newsie should ignore the unallocated number. It does this if you download headers before deciding which messages to download later or read online, but has a problem if all you click on "read offline" in the "subscribed newsgroups" window. It stops downloading at any unallocated X-ref and waits for a time-out.

This seems to be the case for both 0.94 and 0.96, although it appears that one atari user on zetnet does not have quite the same problem with them.

Does anyone have this problem with different servers ?

John, are you aware of this and can anything be done about it ?

Cheers

Paul

I'm glad to hear it. Have you compared it to the 740? I'd be
interested in hearing how it compares quality-wise.

I have not personally tried the Epson Photo 700, but it and its
cousin, the Photo 750, are both ESC/P2 printers, and hence will
work with NVDI. Unfortunately, the 700 is already discontinued
and the 750 is likely to soon follow. The other Photo printers
are ESC/P Raster.

If anyone has tried a ESC/P Raster printer on an Atari w/NVDI
I'd love to hear of it.

In other news, I'm becoming reasonably confident that any HP
Deskjet (except the Windows specific ones [710,720,820,1000
series]) will print 300 dpi color, since they will all respond
to the 550C driver without error. I do not know if they will go
higher. Of course, since all HP deskjets (except the ones
noted) are PCL3 printers, they will also print 600dpi black
using the Laserjet driver.

If you execute Dialer after just booting your system, just exit
DIALER the check out the SERIAL and STING internals and the should
be set for running, then copy over the new CPX's and configure as
the old ones and SAVE.

I've never seen this, either. DSDD floppies formatted under
WinNT (either DOS prompt or Explorer's formatter) for 720K
work just fine, no extra anything. The only stupid thing
I've ever seen is the conversion of long filenames to
6(~1).3, but I know what that's all about.

Hi Dan,

there's the rub, 'If the Milan sells well'. My point is that, to succeed, the Milan has to compete with and win over would be PC and Mac buyers and without a. a very very good marketing, b. a very very attractive price eg 2/3 price of 'an average PC/Mac', I don't see these buyers dipping their toes into unknown waters. I hope that I am wrong. You and I know that the TOS/Magic/NAES operating system is much much friendlier than Windows and the Macs, but the respective users of these systems are miopic and have a vast range of books and magazines continuously telling them that their way is the best. I haven't even mentioned the comparative amount of software on the three platforms, so what if the PC and Mac programs are 'bloated', to the end user, all that matters is that they work.

The Sh205 was a hard drive based on the MFM system. My understanding is that Megafile drived were all RLL, which basically yielded another 50% of usable space when formatted.

I managed to get a 40 meg mechanism years ago to replace the original 20 meg in my SH205. I think the MFM drived went up to 80 megs, but I never managed to locate one. Years ago on GEnie, there were schematics floating around showing how to replace the MFM unit with straight SCSI, as MFM and RLL drives are long out of production (as far as I know) having been supereceeded by embedded SCSI drives.

Message-ID: <396A8F91.F64C9C40@psu.edu>
Source record: 59853

Hello,

I am trying rescue a Supra 20M external drive. The drive inside was toast so I replaced it with another 20M mech I had lying around. Unfortunately, I can not seem to get it to format - I have tried Atari's HDX 5 which sees it, but can not format it even though I modified the WINCAP file with the drive parameters.

It is an Apple SCSI Miniscribe 8425S that I know works. ANy help out there?

Also, while I have your attention - I am looking for the power supply specifications for the Translator One from Data Pacific (allowed you to read/write Mac disks with the Happy Sac/Spectre 128)

Thanks

-Marlin

>
>www.steverosie.demon.co.uk/programs/dcform3.zip
>
>It's quicker to transfer via floppy if you can, rather than using
>Ghostlink.

Well, after a lot of swearing I was able to get my PC to format a
compatible disk, but it takes a lot longer to read then the higher
capacity disks. Also, the directory looks fine when it's on the PC,
but when it gets moved over to the ST, it comes up with a bunch of
folders that don't exist (they appear on the ST's screen, but when you
try to load one, it says it doesn't exist) Comments?

>Erm! Sorry chap but when you request these things via a newsgroup you
>the replies will be via newsgroup and not via email! Netiquette...

heheheh I know, I know. I usually just ask as my ISP is not as
reliable as t should be, but my mail server is usually more reliable
than my news server... Redundancy is key, right? :)

Another question, don't know how to start with this one... I've got a
case. I bought it used for $5 for the heck of it. I just don't know
what is supposed to go in it. It was a standard PC AT case, but it
has been modded. It has what appears to be 2 midi ports and a phone
jack built into the back panel, and the power cables have been heavily
modded. More details available upon request. When I noticed the two
midi ports, I thought it might've held an Atari at one point. Any way

of being sure?

Well, thanks for all your help, as I am now off to finally get some new software onto my ST. :)

Guillaume,
Ooops! Did'nt mean to imply that Apex vewers had quality loss!!!
What I meant was that since Nview has such a long list of different
types of files that it can read, would it be possible to get all
(or most) to load as fast as Apex does but not loose quality due
the possible different methods needed to speed up loading of each type?
I have about 4 or 5 separate Apex programs with each one written to
view a specific file extension (one for JPG, one for GIF,etc.).

Hi Paul,
I had this problem when I was with Zetnet, and it began to
annoy me, especially as I was paying for the sevice.

I don't think it was Newsie causing the problem, as since
transferring to Freeserve its never happened, and as far as I'm aware I
receive all the posts. On odd occasions whilst downloading the news,
the downloading hangs for about 30 secs. It then continues and at the
end it shows one still to download. I just click on 'read for offline'
again, and that one is downloaded in a flash. This doesn't happen very
often, and all the posts are complete.

Regards
Mike

Chris Crosskey wrote:

> Unfortunately my manual is in German :-((...I'kll check the README
> though...

I see. I'd once again like to point out that in general you should ensure you get an English manual in case you can't read German texts. There are distributors selling the German version of HDDRIVER in England or the US and this version is often cheaper than the one with English manuals, which have been translated and printed by System Solutions in England. They made a good job with this and since they spent quite some time on it HDDRIVER with an English manual is probably more expensive than the German version. But having a manual you actually understand (and thus enabling you to really use the numerous options offered by HDDRIVER effectively) is definitely worth paying a little bit more. Most products for the Atari are not really expensive anyway.
Something else to consider: The English version distributed by System Solutions is always up-to-date, since they get their binaries directly from me as soon as a new version has been released. BTW, the current version of HDDRIVER is 7.9.

Hey everyone! I'm having some SCSI problems with my TT. I recently connected a bid old Seagate 8 gig full-height drive to my TT. The drive is a simple Fast SCSI-2 interface. Now I connected the drive to my SCSI chain that also has the internal 120 meg TT drive and another external Quantum SCSI drive. The external drive may very well be SCSI-1. The new 8gig drive is at the end of the chain and is set as ID2 (ID0 is the internal drive and ID1 is the external 120meg drive). The software in use is simply AHDI 5.00

The 8gig drive was partitioned on a DOS machine (DR-DOS actually) and set to use 4x 2 gig patitions set up with 32-bit FAT (if I remember correctly). The drive definitely works.

Now my problem occurs at boot-up. After the AHDI Bootloader successfully detecting all the drives, boot starts and just about everything in the Auto folder bombs until about 4 programs load and the system locks. The stuff loading is pretty light: SpeedoGDOS, a graphics card driver, and HSM stuff. Other stuff should load too, but once it get past this stuff, the system locks.

If I remove all the auto folder stuff, the computer just bombs while loading GEM from ROM. If I can get the system to boot into low-res GEM, it will not install the 8gig drive, so I don't think the system is seeing it.

So does anyone have any ideas? I thought it might be the hard drive driver. Would installing CBHD fix the problem, or should I go with a commercial package?

If anyone has an idea about what's happening, let me know! tHanks in advance!

383. Milan 2 vs Athlone PC

Newsgroup: comp.sys.atari.st

Hi all,

Bengy reports a report at:

http://users.skynet.be/atarix/mamil.html

re. the above topic. It's in french but I think it shows that against a top end PC running MagicPC, GEMBENCH figures show the Milan 2 to be very very much slower. I know that the PC was running at a much higher rate than the Milan and that the Athlone is much more advanced than the 68060, but both the PC and MagicPC are out there and probably cheaper after the addition of all the cards etc to the Milan. Just seems to high light the up hill struggle for the Milan to make it in the real world, not to we Atari nutters and Milan 1 owners, but to the vast majority of Joe public.

BTW has any one managed to print out the above web page, it's writen in such convoluted HTML, almost every line, including the GEMBENCH table is individually aligned/coded etc, such that my LaserJet 6p locked up trying to spool and Wordperfect crashed trying to decode it!!! The code takes up 15 A4 pages using Courier 8pnt !!!!

Bob King.

Hi Steve

When it didnt work I still had it set up right. It was the ST's
hardware to blame not any software setup.

Because that signal is a weak spot in many STs - in terms of stability, you
are usually better off with an extra oscillator instead of adding load to
the 32MHz clock if you don't need the signal to be phase-locked to the
system clock (which is a waste in case of the FDC clock).

Note that AHDI doesn't support SCSI drives larger than 1 GByte. You will
only be able to addres the first GByte of such a drive, if it works at
all.

I don't believe AHDI handles such big drives. I'd recommend you to try
HDDriver instead.

Sounds like you don't have a terminator inserted - or maybe that you
have more terminators than one at each end of the chain (perhaps the
external drive closest to the TT is terminated without you knowing it?).
Could it maybe be that the new drive demands arbitration? In that case,
you need HDDriver or other driver which can handle such drives.

Ugh! You will find Cubase hard going in low res. Watch this group for an
SM124 or SM 125 high res. monitor - very nice.

Don't rush into the upgrade. TOS 1 should do you. It's a bit slow on hard
disc transfers but otherwise quite serviceable.

Hi Mike,

I think the above shows that it is infact still happening. The
downloading is stopping for a time-out, which will vary depending on the
number of unallocated X-refs.

Newsie expects to download a given number of messages so you then get the
message showing one or more still to download. I suspect that when you do
this, you will find that you have simply downloaded a duplicate of the
last message. This is what happens to me.

The fact that you no longer see the <no subject> header may be connected
to the different server. When this happens again, you might like to have
a look at the X-refs and see if there are any missing.

Newswatch spots the problem and instantly goes on to the next message.
This seems to be a bug in Newsie which John may not know about. I'll let
him know, but I was waiting to see if I could find out any more from
feedback here first. (John, are you reading this anyway ?)

Cheers

Paul

Guillaume,
Ok! So since we're on this subject, I would'nt mind if Apex had
more programs (separate viewer type) to cover additional file types!
Do you know if Apex is still active? (Better yet, for single TOS a
browser that loads pic files as fast as Apex and covering more file
types). I mention single TOS since CAB looses it's relative position
('Back'/'Forward') after recovering from Apex kicking in as an
external viewer! But, I believe Javascript is more important in a browser
at present. Anyway.....

If it's any consolation, Netscape displayed a blank page with a blue wavy graphic on the left border, so I didn't get to see any of the data at all! But the test is not fair since Atari programs are not so demanding of hardware resources as PC programs are. The way to test a computer is using it with applications you use everyday. My 50MHz Falcon is faster than my 300MHz K6-2 on everything except web browsing.

<<SNIP>>>

If I understand you right you mean like clicking on readoffline when
the messages are not continous. e.g
1
2
3
5
6
7
Where it misses 4 out because there wasn't a message there.

I've had this with newsie 0.94. It would hold on the 4 for about 30
seconds then continue to the next. It doesn't do it anymore though
asnd I haven't changed anything on my side, so it must be my server.

I'm with Madasafish in the UK.

Hi Jeff!

1) You'll need FAT 16bit unless you're running magic/mint.

2) I think you'll need smaller partitions due to tos limitations
(again unless you're using magic/mint)

3) Buy HDDriver. Well worth the money. Lots of useful options...

Hope that helps.

Source record: 59882

Hi
I want to move my data from the SCSI Hard Disk of my old Atari STE to a PC.
For this purpose, I am thinking of the following possibilities:
1. via a cable between the both serial ports. Which program do I need at the
Atari side and which one at the PC side? I know the program "connect" that I
former used to dial via modem to the internet from the Atari. What has to be
set in this program for the exchange I described above?
2. Furthermore, I have a SCSI-Zip drive. Actually, I run this drive on the
PC, but it works well also on the Atari. But: I don't know any possibility
to create a ZIP medium that can be read or written on BOTH platforms.
Somebody said to me that it's no problem with MagcPC, but I don't posses
this system.

Does anyone know a solution?

Martin

You are correct and give good advice.

>> Now my problem occurs at boot-up.
>
>Sounds like you don't have a terminator inserted...

I don't think so, although it's possible that this is a (not
THE) problem. Termination problems generally are more random
feeling in that the boot fails at different points, or files
seem corrupted and then get better again. The advice is good,
however, in that you should make CERTAIN your termination is
correct.

The author was attempting to compare the Milan II to an Athlon 600Mhz running MagicPC, so in both cases Atari programs are being run. However, the author could only use ST-ZIP and Gembench for comparison, since these are the only two programs that he (and I) know of that have had their results posted by Milan Computer. I don't think that ST-ZIP is a real good test (BTW, the Athlon was about 8x faster) in that archiving via ZIP is very math intensive and is one of the places where chip speed really matters. In the other tests the results were mixed (I'll try to post them below) but generally favored the Athlon w/MagicPC. The author's point appears to be that MagicPC yields results similar or better to the upcoming Milan II. Perhaps this is so, but the tests done are too few to be conclusive.

>this system.

Hi

What I, did with EZ carts, and do with MO optical disks now; is format
the disk using HD Driver in compatibility mode selecting the TOS/DOS.

Then you can write to the disk from the Atari and read it via PC, and
visa versa. The only problem is that you are restricted to one partition
and the partition limit on the Atari's.

There are a couple of filename the poor old pc can't cope with:)) and
the Atari can tackle very easily. So look out for odd characters $%&
etc.

If you get an error when copying the file this will be why, so it's
worth making a mental note!

>very much slower.

There is a discussion going on on fr.comp.sys.atari if the figures are
correct.
To be fast (Milan II) or very fast (PC + Magic PC)
The author also adds :
With the new DSP card "Deese" by R.Czuba and with applications that use this
card, the Milan II will be just as fast as the current PC's.
If the Milan II sells well, there will be a Milan with PPC. Another reason
to buy the Milan II !

Hi.

Try using a mega keyboard with the ST, much better feel and it can be placed
where you want it, the mouse plugs into it as well.
Try Keychange Music, 01925 266120, they have some in stock.
Phil.

>What? Perhaps it's due to my use of higher TOS (1.62, 2.06, %
>4.04), but I've never seen this. Could you elaborate?

It could be a difference in TOS... (grumble,grumlbe, stupid version
1.2)

Well, ok, here goes.

This is an example of just one disk, the names ofthe files in question
are different on other disks...

The disk has 3 folders which appear on both machines. They are
"bughunt", "jetset", and "missile". Both machines agree on these.
The ST has three added files: "Ab.", "AJ." and "Am." I have the
option of viewing these, but when I select "show", it just loads up a
blank screen, which will automatically go back to the desktop within a
second. They do not appear to take up any space on disk.

The PC is running an AMD CPU and WIn98, while the ST is a stock
1040STf.

They haven't hurt me yet, but I wouldn't mind knowing what they
were...

Good to know there are plenty of Atari Bikers :-). Just to let you know, it was a motorcycle crash which made me a house hostage and with nothing to do and I dragged out the Atari connected to the internet and I have been here ever since.

Oh and if people wonder why I disappear most of the summer from this NG, it is because I am travelling to motorcycle racing events across Canada and the United States.

If all goes well I should be in Italy come October for World Superbike.

That said, I think Jo will be on the net before he is back on the motorcycle;-).

Get healed soon.

Later Brian.

MagiCPC is not required. With HDDRIVER you can create ZIP media that can
be used by both Windows and TOS (i.e. the media are Windows and TOS
compatible at the same time) without any additional software.

Hi!

Just like to know where Andy Blakely has gone (aka anakimana).

I haven't heard from him since 22nd June he usually replies emails
next day.

He hasn't been here either since then.

He didn't mention anything about going away in the last email I
recieved.

Is he Ok?

Have no fear, Andy is here!

Has it really been that long? Hmmm... sorry about not responding, I guess I ran out of things to say. Anyway I'm still here. I've been scanning through the newsgroups everyday, but haven't found any post I could really jump into.

So, how is the HybriD FDD module coming along? It will be nice to have 1.44's on my STE!

Andy Blakely

Tim Conrardy heeft geschreven in bericht <8ki08b$j65$1@nnrp1.deja.com>...
> Anyone use or have any feedback on the Milan for Midi work? Will it
>run for instance Omega II KCS or Notator, or even Cubase?

Hello Tim,
I have a Milan 040. Cubase Score works perfectly on it. You need to install an extra Romportcard for the dongle. The other softs you mention, I don't know.
I also use Score Perfect Professional 3.1 (SPP) which is great for writing notes (very fast formatting and printing) and midi. This woks on the Milan too.
It is already known that Cubase Audio won't work on the Milan II but I'm sure that after release of the Milan II there will soon be software for HD recording. Woller Systems in Germany has already made something for HD recording.

Cheers
Dan

Hi

I've got a couple of disks to shift, well 1,000 or more. They all have pd or shareware on from the 'former' LAPD PD library and will sell them in banks of 100 ideally in the UK as postage from here is likely to be expensive.

They are sold on a first come first served basis.

The cost ï¿½7.50 per 100, plus postage saving ï¿½142.50 (based on 100 disks @ ï¿½1.50 each).

I would say the Milan performed pretty well considering the AMD is
running at least six times faster in MHz than the Milan (what is the
Milan II clock anyway?), but the numbers are not consistently six times
faster, and the milan is sometimes faster.

---Something strange occurred to my post -- I'll try again --

The Milan II is said to be a 66Mhz 68060, but one should note
that the 060 can (in most cases) deal with three instructions at
once, so it is said to be roughly identical with a 200 Mhz
Pentium II.

That said, I'm looking forward to having a Milan II, although I
admit that I'm worried about the supply/repair issue,
particularly since David Acklam never did get his Hades60 back
from Computer Direct. I'm hoping for a reasonably good supply
of Milans from a long-time Atari seller.

Uhm, did you forget that the Athlon was running an Atari emulator?
It would have been extremely surprising if it had come close to
running as fast as a 600 MHz 68060 would.

The point of the original test was that you can run your _Atari_
software faster in an emulator on a modern PC (and now that the AMD
Duron is about to be released, a machine such as this can be had
pretty cheap) than you can on the fastest possible Atari compatible
machine (which is not even available yet, IIRC).
This should not surprise anyone who knows a little about modern
processors.

When running x86 code that Athlon would likely be more than ten times
faster, in most cases, than the '060 running 68k code.

>The Milan II is said to be a 66Mhz 68060, but one should note
>that the 060 can (in most cases) deal with three instructions at

It most definitely can't.
I actually don't think _any_ ordinary processor gets even an average
of two instructions per cycle on 'normal' code.
Sure, their 'potential' can be much higher, but that doesn't mean much.

>once, so it is said to be roughly identical with a 200 Mhz
>Pentium II.

The '060 is pretty much comparable to the original Pentium.
It would not be as fast as an equivalently clocked PentiumII (if there
had ever been such a beast).

They have to do with the long filename format.
Although the original filenames may not exceed 8+3 they will be put as long
in the floppy directory (to be able to use lower case for instance)

My experience is that the extra entries are not created when you command Windows
to be case sensitive, and you rename the files explicitely in upper case, not
exceeding 8+3 of course.

(Dont ask me how I succeeded to specify case sensitivity :-)

Hi Tim,

On 12 Jul 2000 14:44:30 , Tim Conrardy wrote:

>Also is the Hades good for Midi?

I use it for Cubase Midi without problems. You need a card for the dongle ports, and there's a bit of setting up to do, but Cubase Midi runs fine on it, as long as you don't have the Mach 64 graphics card. (It seems to run fine with the new 8meg Ati Rage card.)

I've also found that Cubase prefers to run on a clean system, and it has a conflict with the SCSI port. No problem with the internal drive and floppy.

The big plus is the amount of music on the screen in 1024 x 768 (which is my usual resolution) and the speed of the screen re-draws. Sitting and waiting is a thing of the past :-))

Cheers

Paul

Hi,

swallow@intergate.bc.ca (Puppy Dawg) schrieb am 12.07.00 in Mitteilung
Nr. 396bc917.584779@news.intergate.bc.ca:

PD>They haven't hurt me yet, but I wouldn't mind knowing what they were...

Theses are the file name entries for Window's long file names. The VFAT long
file name system is based on the old FAT system, where file names were limited
to 8 characters plus a 3-character extension.
The new, longer file names have to be stored somewhere, and Windows (and also
does MagiC since V.5) therefore creates additional directory entries, which do
not point to a file on the disk, but only contain parts of a long file name.

If You change theses "special" files or delete them, the long names will be
corrupted or deleted, as You can verify later under Windows.

bye,
=Gerhard=

It's an Olga client to allow non-Olga aware apps to take part in the protocol. I don't have a URL but a web search for the author Thomas Kï¿½nneth should produce a result.

I see, I see. Does GEM only do this in the root directory, or are all
extensions placed in the root directory, as they are on my disks?

I'm just curious, is there any system/pattern to the extensions? I'm
sure there is, I just haven't found it yet...

Anyways, thank you all for all your help. My ST and I are forever in
your debt. :)

Do you want to say you haven't phone him yet? :-) HDDRIVER 7.9 is
already available from System Solutions.

> BTW, could you tell me a bit more about the FAT 32 scheme and what i
> need to do in order to implemenet/use it please?.

FAT32 requires MagiC or MiNT and with HDDRIVER 7.9 you create TOS or DOS
compatible FAT32 partitions without having to use other software for
this. Creating a FAT32 partition is no more difficult than creating
other partitions. You just have to enter the partition type as explained
in the README of HDDRIVER 7.9.
But once again note that TOS itself can't handle FAT32. MagiC or MiNT is
required. With FAT32 there is virtually no upper limit with respect to
the partition size.

Due to the exhaustive memory consumption I suggest more RAM for the C++
compiler.

Gembench needs to be trashed :0) A benchmark application coded to take advantage of the 060's RISC functions would reflect better performance. Ya, ya, cheating, just like compairing a P3-600 to it. It's the hardware compatibility of the Milan that makes it sexy to me, IMHO:). MagiC on a PC.....Crashes enough on the Mac for me. Does reboot fast! Lets see, Gembench, ST Zip and CAB. Thats about all the useful TOS applications that can be used. I personally like to use DynaCadd, Chronos, Phoenix and many other "Atari-TOS-MiNT-NaES" only applications, regardless of their age. Hi Katherine:)

Yeah I don't care if it's slower than the top notch PCs.
The reason why I want to by the Milan II is because

1) My ST would take to much money to upgrade.

2) The Milan has a great range of software included which you don't
get with MagicPC and I'm sure MagicMilan will run a lot more ST/Falcon
software than MagicPC.

The average PC owner doesn't use the full power of a 600mhz PC except
for games which are very demanding.

I remember reading in the STC report that the 68060 will no longer be
produced BUT the Coldfire chips (which some are 060 compatible) still
are. And the Coldfires could be supllied at 200 and maybe 400mhz
speed.

Now that would be fast!

I would suggest using DOS mode on the PC when messing with anything
Atari related. Windows is very complicated with all it's virtual
memory and memory management, among other things. :) I don't recall
seeing stuff like that after adopting DOS mode. BTW, I'm not referring
to a DOS box from Windows, rather, a clean boot to DOS.

Huh? Three?

AFAIK, there are only two integer instruction pipelines on the 060.

Another note when comparing those results: the Milan benchmarks were not
done on the final machine with full-speed SDRAM.

Computer Direct's irresponisble disappearance from the Atari scene should be considered a fluke, and not reflect on the Milan at all. If Chris didn't want to deal with Atari anymore, that is his choice, but to ignore responsibilities to customers in inexcusable. The chance of Milan Gmbh being equally irresponsible is unlikely, though the recent demise of Centek reminds us that any companies existence in the Atari market is fragile at best. The main thing is that once you obtain a working computer, they rarely need any repair or attention when properly cared for.

Well again, here we are getting into issues like OS and software,
because I've got a Windows 95 P120 here gathering dust that is dog slow.
As said before, my 50MHz CT2 Falcon is decently fast and as comfortable
as my 300MHz K6-2. The CT60 (100 MIPS) is over 9 times faster than the
CT2 Falcon (12 MIPS) (Standard Falcon 3.84 MIPS). So I don't expect the
Milan II to be any slouch.

>Now experimentation is called for to see if I can find out why.

Definately works fine here Trev. Are you using MagiC or TOS with STinG and when does the crash happen ie. after loading all the modules or before? Also, What Veloce mode are you in 68020/68000? I had a problem with CAB where if I switch from using 68020 to 68000 mode CAB crashes with 2 bombs. I think this is because the Veloce writes 32 bit data to the drive and the 68000 doesn't like it! Deleting the CAB Cache cured this problem. Another Veloce user had a similar problem recently and this seemed to help:

1) Install the STinG package in 68000 mode - to allow for processor switching.
2) Always start with a fresh installation - no using old cpx's, modules etc.
3) Only activate the Sting Internals and Serial CPX's.
4) Make sure these modules(STX) are active only :Serial,TCP,UDP and Resolve
5) Ensure the paths are set up correctly in the STinG.INF and DIAL.INF files.
6) Check with your text editor that there are no blank spaces after entries in the STinG.CFG and Dial.SCR files.
7) De-activate the Cache.DNS file and let STinG create another one in case of corruption.
8) Try to stay in 68020 mode when using Internet applications - if possible.

Hope this helps.

>AFAIK, there are only two integer instruction pipelines on the
>060.
>
From Motorola's Website (http://ebus.mot-
sps.com/ProdCat/psp/0,1250,MC68060%7EM934310184622,00.html):

MC68060 Features (partial)
Completely User-Code Compatible with the MC68040
Superscalar Implementation of M68000 Architecture
Executes Three Instructions per Clock

Although there are only two integer pipes, a branch instruction
can be made simultaneously as well.

As for comparison, the 68060 has roughly the number of
transistors (2.5 million) as the Pentium I and has a similar
MIPS as the Pentium w/MMX 233 or 266 (100-110 for the 68060, 104-
114 for the Pentium). [Source: http://www.pc-
micro.com/informat.htm] There never was a Pentium II 200, but
since the Pentium II 333 is 145 MIPS and the Pentium II 400 is
174 MIPS a little interpolation (accounting for the fact that
it's nonlinear) places the 68060 about where the Pentium II 200
would be if it had ever been made. I think my logic is correct.

In any event, regardless of the idea of supporting the Atari
community (a good one, in my opinion), the Milan II should bring
us up to about 1997 technology. While this seems unimpressive,
it is in reality mighty fast considering our tendency towards
tightly coded applications.

Atari drives hook to Atari computers via a nonstandard 19-pin (I think) cable. An adapter cable that actually contains certain electronics inside it enables you to hook standard SCSI drives to your Atari computer. Both will not be found at a typical computer supply store.

Yes I was not too happy when Chris disappeared. Now and then he answers my email, but he does not talk too much Atari. But you are correct. My Hades is still going strong (also my STe).

Well Notator may run on a Hades. I know there is a dongle card out there somewhere that is support to work. I have also heard there is a version that will run without the dongle.

A standard 15pin DMA cable if the hard-drive is an Atari megafile, else you need a device called a Link that allows SCSI deviced to be used on the ACSI bus of Atari computers (but not Falcon, since it's got proper scsi)

>FAT32 requires MagiC or MiNT and with HDDRIVER 7.9 you create TOS or DOS
>compatible FAT32 partitions without having to use other software for
>this.

So what happens in the boot phase when HD-Driver is booting in a TOS
environment, is the bootsector TOS compatible. Does this also mean i'l
not be able to access my drive if i revert to TOS?.

>Creating a FAT32 partition is no more difficult than creating
>other partitions. You just have to enter the partition type as explained
>in the README of HDDRIVER 7.9.

Ive not translated this yet, although a cursory galnce renders that....

....I notice the implementation of the default language selection, well
done.

Personaly i have HDDRUTIL.APP setup in Jinnee's Installed Applications
menu and i send it a command line on execution of -e, in difference to
the readme which states --e. -e works, --e does not, which is in error?.

>Also is the Hades good for Midi?

I can answer the Hades questions as I have one. Yes, it is good for MIDI. I use it with Sweet 16 and my older Roland MT-32 MIDI module. To access the ports you need one of those connectors that you want use with a PC that fits in the back of a Sound Blaster card. KCS Omega does not work on a Hades. I am not sure about Notator, but Cubase will, but only in a mono resolution.

At this time I have two C-lab Falcons both running CAF and with
FDI's(Soundpool).The Digital out of the "master" is connected
to the Digital in of the "slave".In the Hardware Setup menu of
the slave i choose "FDI"(the clock is from the Fdi of the master).
The master is sending MTC to the slave through a midi cable.Both are
running with the same bpm.I have recorded 8 tracks Audio on the "slave"
and now I want to record 8 tracks Audio on the "master".I made the
tests and all seems O.K. Are the two systems now accurate synchronized
or I am wrong? I think it works like a 16-track system now.I can punch
in on the master and the slave follows without a problem.Somebody an
idea?

well, Tim, we know that for the original Milan 040 it does require
the use of a sound card. For the Milan II, though, the good news is that
Milan GmBH revised the board so that it now has a pair of MIDI ports
standard - this was in response to many musicians' concerns. And I would
imagine that someone will eventually come up with a driver for allowing
the use of USB MIDI adaptors for additional ports (the Milan II has USB
standard).

I know that Systems Solutions advertises the Hades as being
compatible with Cubase Audio, and have heard of some Milan users using
it for hard disk recording using a program/PCI card called Star Tracks
(?), which I believe was originally developed for the Hades.

For anything that used a physical dongle, you'd need to use a PCI
card that will take the dongle.

hmmm, since your Atari pages includes MIDI "liberated" ware, and we
have a number of Milan users in this forum, I see we can at least
probably do a grand experiment with those to see if they will run :)

There is also a check box in I believe the sync menu or the digital audio set up that allows you to separate the digital audio sync with the midi sync. You will want to make sure that the sync is separated. Yuor midi tracks will follow MTC and the audio is now running off the master digital clock. I assume you are using MMC to start and stop. MMC will only work properly through the Falcon's built in midi ports.

On 6 Jul 2000 11:23:50 -, Derryck Croker wrote:
>Thanks for the info Paul, sounds promising!

You're welcome.

The software has been extremely stable and useful to me. I've been recording WAV files of a lot of my music to the Falcon from DATs, and then burning ISO9660 CDRs of the WAV files, to transfer to my PC to create MP3s.

Plus, I've used it to make some backups of my PC's hard drive - transferring files over on SyQuest cart to the Falcon (utilizing long file names under MagiC 5), and then burning CDRs of the data - freeing up PC hard drive space in the process.

This opens up a whole new world for your Atari IMHO...

>reformatted with HD Driver to cure the drama?

Something to consider I guess. And for the record, the drive was
originally formatted with ICD Pro to be AHDI-compatible. But I would think
that if this was the cause of the problem, then the bombs and crashes would
happen in other apps too, not just when recording STEREO audio files in CAF.

A few other digital audio recording apps I've tested work fine with both HD
Driver and ICD Pro. Strange...

Thankyou for all this great Info (as well as past responses)YES..now
that we have have some great Freeware to try out, I would appreciate
some experimentation on these newer "modern" Atari's. Feel free to
download anything from my site.

BTW..Just released Cris Sions Copyist DTP! It is now available on my
page.

David Snows Atari Midi software is next.Stay tuned!

Tim

I would like to invite anyone of you to the Atari-midi mailing list.

Hi Steve,
Yes I use it with my Mega STE, and have done with an
STFM. I've recently bought a PC and use it also on the internet.
However the ISP I use for that only seems to find about 10% of the News
items I download with the Atari, so I stick with the Atari for the
Newsgroups.

Gerhard,
If you're using ICD to boot your HD with, 'Cleanup.prg' will let you
re-name bad filenames. Note: bypass the sector test (it takes forever)
and if prompted to "reconstruct.....chains/files" click "NO" or you'll
need another program like Diamond Edge to rename files that start with a
"?" which Cleanup.prg creates!!!

Gerhard,
If you boot with ICD, CLEANUP.PRG will let you rename bad
filenames. Note: Bypass the sector test if you don't need it (takes
forever) and click "NO" if asked to "reconstruct.....cluster chains"
or you'll end up with a "?unknown" for new filenames which you'll
need Diamond Edge (or similer) to rename!!!

Thanks for the reply John. I am not using 0.96 myself yet. My problem
is with 0.94, but I mentioned 0.96 as others on the zetnet atari list
were having the problem with it.

I will go back to the list and see if anyone can get a log file from 0.96
to send you. It is re-assuring to find that you know about the problem
and it is being dealt with.

Thanks for continuing to develop a very useful piece of Atari software.

Cheers

Paul

His disappearance occured in an untimely manner while I was dealing with a defective Nemesis that ATY Computer had bought through him when he was the North American distributor for Titan. ATY wanted Titan to honor the warranty for me, and Titan wanted it to go through channels. Since Chris wouldn't respond to Alex, I was stuck with the Nemesis. Luckily I got my money back through Visa's dispute process.

The Notator list says the cracked version is okay as a demo, but crashes
and has unreliable timing. I doubt the dongle card would help it run on
Hades since Notator won't run on TT or Falcon.

>disk bootloaders kick in?

Hold down control or alternate, try either i cant remember which one, one
bypasses hard disk boot, the other bypass's AUTO folder loading.

If AHDI is not totaly poxed holding SHIFT - SHIFT might sort it.

I see it this way: my falcon is adequate for _most_ of my
computer uses but a bit too slow for the internet and some
graphic applications. Then, a computer 10 x faster with better
graphics like the Milan is an excellent option. A PC with MagiC
PC can probably be faster in some areas, but I'm sure I'll be
saving a lot of time don't booting windows and then MagiC PC.
Oh, don't to mention reinstalling windows every other day.

I update my catalogs once a week. Just before this message is posted. So when you see a new posting, check my Catalogs. After I post this message. I'm off for the weekend. But I'll be back after the weekend.

Check out my Atari Catalogs. Find Hardware & Software, +NEW in BOX/BAG! Dealing in Atari Lines for Classic Atari 8 Bit, Atari ST and the 64 Bit Atari Jaguar Game Machines. Especially my ST line of Software, lots of Games +NEW in BOX As well as Jaguar, +NEW in BOX! To find these, search my Catalogs looking for the text "+NEW in BOX" to find these items!

Discounts apply to both Used and +NEW in BOX/BAG Atari items! Including Classic Atari 8 Bit, Atari ST and Atari Jaguar lines of Atari Computers & 64 Bit Jaguar Game Machines. And I sell and ship to most any Country!

Looking for Free Atari catalogs? Skip to the bottom, otherwise read on!

To take advantage of Atari Discounts or FREE Atari Items, Please Read on. These offers are like Coupons, designed to attract business, still, if a customer does not redeem/present the coupon, I am not obligated to honor it. To redeem the coupon/offer, you must E-Mail me to Claim it by repeating the offer and state what you want to buy! Please be specific!

e-mail: atari@benjamin.net

To take advantage of Discounts, FREE Monitors or FREE Jaguar Cable, you must E-Mail me to Claim it and state what you want in E-Mail. Read on!

Discounts! Buy now! 5% Discount with a $50 Purchase. 10% Discount with a $100 Purchase. 15% Discount with a $150 Purchase. And a 20% Discount with a $200 Purchase. Discounts Apply to Classic Atari 8 Bit, Atari ST and/or Atari Jaguar. Hardware, Software, Books & Accessories! Both Used and +NEW in BOX/BAG! And I ship to most anywhere in the World!

FREE Monitor with Atari Purchase! Buy either an Atari 1040STF, Mega ST2 or 1040STe & receive a FREE ST Monitor. Your Choice of a Color or Mono-Chrome Monitor. FREE Monitor when purchasing an Atari 8 Bit Computer. Buy an Atari 800XL or a 130XE and receive your choice of any Monitor in the Atari 8 Bit Hardware Catalog. And FREE when purchasing $50 worth of Atari Jaguar items, receive absolutely FREE, a +NEW in the BAG Jaguar Stereo Audio/Composite Video Cable.

Offer Available for Limited Time only. First Come, First Serve! Subject due to availability! Customer pays Shipping! Substitutions considered.

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out into Atari Jaguar Hardware & Games. So checkout what's new on my Web Site. In Fact, check it regularly as my Catalogs are updated regularly. Customer's are served, first come, first serve! No competing in auctions. Just Sales, Support & Service! I have 8 different Catalogs, & my SoftWare Catalogs are my largest. They have the biggest Byte Count. You should see my inventory! I have TruckLoads of HardWare, Boxes and Boxes of Software & Libraries of Books & Reference Material for the Classic Atari 8 Bit, Atari ST & the Atari 64 Bit Jaguar Game Machine! And remember, if you can't come see me today, come see me tomorrow!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari 64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump to my FTP site linked to my WebSite so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor & view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or bensmith@teleport.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to bensmith@teleport.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

Hello.
At present I am using version3.30b of WenSuite3. But I was looking on the atari.fr as my french is that strong. But I think it mention about work on the 3.40 version. As you can see from this news reply, its not too bad.

regards

John Nicholas Oakes

Alright, I have a seemingly simple question. How can I force a boot to strictly ROM TOS or a floppy before any hard disk bootloaders kick in? I need to overide AHDI before it turns on since I corrupted the sectors on my boot HD.

At bootup, the actual AHDI bootloader bombs. Everytime with every configuration. SO I need to access the floppy to fix the drive. How is this possible? Or is my disk gone? Thanks in advance!

I am surprised this is a problem on 0.96, as I purposely reduced the
criteria to identify a "missing" article by allowing any 4xx series
response code to iedntify an "article not found" response for OFFLINE
reading. The OFFLINE reading goes article by article and expects a
4xx response to indicate a missing article.

If you could send me a LOG file with an example of a missing article,
or one that hangs and times out, I would be happy to look at it.

NEWSie 0.94 used 430 (I think), but some servers could use 420 as a
response to a missing article. A Log file would tell me (or you) what
the code was.

John

Hi,

Several times now I downloaded zip files that included files with
blancs in their name. So after unzipping I have files that neither
can be renamed nor deleted. The only way to get rid of them I can
think of is to save everything else from the partition, then
deleting the whole partition and restoring the data.
Does anybody have a better idea ? Maybe some way to edit the
file name table on the HD (the best possible solution since then
I could use the files) ?

Thanks
Gerhard

Try pressing the Alternate key (and keep it pressed until the desktop
appears) right after switching on your machine. If this doesn't help
you'll have to disconnect the hard disk drive, switch on the computer,
then carefully connect the drive, start the driver from floppy disk and
clean up the mess.

>Executes Three Instructions per Clock
>
>Although there are only two integer pipes, a branch instruction
>can be made simultaneously as well.

Yes, but there are lots of limitations as to what instructions can
be run in parallel, and when the branches aren't predicted correctly
they take half a dozen cycles or so.

Motorola themselves say that the '060 is around 1.5 (or was it 1.7?)
times faster than the '040, clock for clock, which would put it around
one cycle per instruction, average (I've seen measurments that had the
'040 at 1.4-1.6 cycles per instruction).
They also say in the '060 manual that it can get <1 cycle per
instruction, which (while it's of course (intentionally?) vague) is
about the same.

>As for comparison, the 68060 has roughly the number of
>transistors (2.5 million) as the Pentium I and has a similar
>MIPS as the Pentium w/MMX 233 or 266 (100-110 for the 68060, 104-

No, no, no!

You should _never_ use MIPS as an indicator of processor speed, unless
you know _very_ well what you're talking about and there is absolutely
no difference in the way you counted it on two different processors.

There is a world of difference between 'VAX MIPS' and 'millions of
instructions per second' (and I'm not saying that VAX MIPS is reasonable).

>114 for the Pentium). [Source: http://www.pc-
>micro.com/informat.htm] There never was a Pentium II 200, but

You'll find that they don't have any '060 numbers on that site, so
there is no way to compare their MIPS with your '060 number.

>since the Pentium II 333 is 145 MIPS and the Pentium II 400 is
>174 MIPS a little interpolation (accounting for the fact that
>it's nonlinear) places the 68060 about where the Pentium II 200
>would be if it had ever been made. I think my logic is correct.

Rather, you should find a place that actually has a number of comparable
results to look at, such as http://www.pcmarkt.ch/spec.shtml
SPECmarks are generally recognized as reasonable measurements of processor
speed (unlike any kind of MIPS). The numbers on that page are SPEC95 and
there have been updates since then, but I doubt anyone has run the newer
test suites on hardware as old as we're talking about here.

Anyway, this is what SPEC95 has to say:
CPU/MHz Int Float
68000/16 0.14 0.16
68030/33 0.42 0.49
68040/40 1.16 1.31
68060/66 2.18 2.33
486DX2/66 0.74 0.50
P5/60 1.73 1.45
P54C/90 2.65 2.07
P55C/233 7.01 5.17
PII/333 13.00 9.55
PII/400 15.85 12.15
G4/500 23.78 22.67
K5/100 3.20 2.90
K6-2/300 8.50 5.80
Athlon/600 27.50 22.20
21264/666 38.00 61.00

As you can see, the '060 is somewhere around Pentium 60/90 speed.

>In any event, regardless of the idea of supporting the Atari
>community (a good one, in my opinion), the Milan II should bring
>us up to about 1997 technology. While this seems unimpressive,

Make that '93-'94 and you're about right.

I have once managed to setup an RS-232 serial port to do it;
RS-422 should not be any different. I have some tips about that
on my page (URL below).

However, since my TT has Ethernet, things are much simpler.

All right - that may be true, however, in normal code, branches do not
happen that often (plus they may flush the pipelines and thus decrease the
effective performance), so you may only account up to two instructions per
clock cycle for real programs.

Even if Motorola says "three", I would not quote that number in the context
of performance comparisons, since it is far off from reality.

Your DR-GEM Atari creates DR- or MS-DOS double density disks in 9 track 80 sector format (depending on whose formatting software you used) and these 'should' be directly compatible with any MS-DOS machine, including PCs. I use an STFM with a box standard DD drive and the only time I have encountered problems was when using a custom format on the Atari machine. It may be that your mistake is to try and use a more modern DOS format in your legacy Atari hardware. I have never known any problems using a standard Atari-formatted disk in a PC drive used to exchange ASC, TXT and DOC files for instance, or ATARI software downloaded from the Web. If you are having a real headache, why not splash out on an ATARI harddrive. ACSI is a dialect of Slow Narrow SCSI and companies like KeyChange Music Services (on the Web) can sort you out an HD and easily fit a standard SCSI port on your new ATARI Hard Drive. Then all you need is a SCSI card on your PC and a cable and your days of agonisingly slow program load and cross platform communication will be banished forever...talk to Barry at KCMS about all aspects of ATARI hardware; there are also available high density drives for the Atari, a much simpler and cheaper solution...

Hello All:

On our FILES section at Atari-Midi:

http://www.egroups.com/files/atari-midi

I have uploaded the MOUSTERPIECE demo.I have the full version and it quite cool. I have created my own "maps" as that is the strength of the program. Basically it is a mouse controller much like Music Mouse with some twists.The "map" section is completly configurable. You can have 3 scales going at once with Panning oand other controller info going on at the same time when you move the mouse across "the map". I have also found that if you slow down the Z axis, and push down BOTH mouse buttons, you get all axis's going to the speed of the Z axis, so it sounds very close to Music Mouse. I have included the Intro below to give you an idea of it's scope.

ANYONE USE THIS PROGRAM? I would like to exchange "maps". According to the liturature from SONUS, there were suppose to be more "maps" available.
In the meantime, check out the DEMO. It may work only on certain machines. To get it to work on My STe, I had to use GENEVA, so go figure.Works fine on my 520ST however.

Tim

_____
Mousterpiece for the Atari ST is an extraordinary and revolutionary software program that transforms the computer mouse and keyboard, into a 3 dimensional MIDI controller and compositional tool. As many as 16 MIDI devices can be commanded at once, providing unprecedented power and control.

Music is created by moving the mouse within a multi-dimensional matrix of notes and MIDI commands. MIDI data is arranged within each map along an X,Y,& Z axis. Each axis provides 4 separate data tracks, containing 61 event points per track. Each event point can store any MIDI note/event, Sys/Ex, or your own custom MIDI commands.

With 12 unique MIDI controls per event point, 732 distinct events, and 226,981 graph points, a choice of over 2,723,772 event combinations can be assembled within any one map and played live. Adding custom macros and live map switching expands this to over 27 million combinations! Separate velocity and MIDI channel information is also provided at each event point.

Mousterpiece is the first entirely programmable, software MIDI controller that makes possible the creation of complex musical compositions with remarkable originality and inventiveness. Outstanding for live performance and studio production. Human ingenuity and computer power unite in a contemporary approach, inventing a new and profound realm of creative possibilities.

Mousterpiece - transforming the vision of music -

With Mousterpiece, your Atari ST becomes a fully programmable musical instrument. You can use the maps, sequences, screens and controller options provided, build your own instrument from the ground up, or anything in between.

Using the mouse and the ST keyboard, you can send MIDI information of virtually any description (e.g. notes, system exclusive, modulation, lights, etc.) according to the position of the mouse cursor. This position is determined by coordinates on three axes: the horizontal or X axis, the vertical or Y axis, and a Z axis denoted by the size of the box surrounding the mouse.

Mousterpiece includes two on-board MIDI sequencers. Note information can be stored in the real-time sequencer, and be played back concurrently with any new notes you send with the mouse and ST keyboard. In addition, ten linkable step sequences can be created and played in any order.

MIDI controller information can be sent directly from the ST keyboard. Specially designated keys will increment or decrement many commonly used MIDI parameters, including modulation, aftertouch, pitch bend, pan, sustain pedal, sostenuto pedal, breath controller and more.

Z-axis speed and snap zoom increments, numeric function key program change assignments, controller key channel assignments, and location of screen markers can be programmed individually. All maps (five on a 520 ST, ten on a 1040 or Mega) are fully editable. Virtually any type of MIDI data can be mapped onto a screen location, including custom data types that you create.

All the above information can be saved or loaded individually or as part of a larger file. Maps can be printed in compressed or standard format.

Mousterpiece is an open ended design allowing unlimited musical composition, performance and yet undefined capabilities. Mousterpiece can be used for any MIDI application such as a live MIDI light controller. Years of experimentation will be required to even begin realizing the power of Mousterpiece!

--

I would like to invite anyone of you to the Atari-midi mailing list.

Hi JJ!

On my site you can download a copy of Llamatron by Jeff Minter. This is a
remake of Robotron!

http://www.users.zetnet.co.uk/jfhaslam/atari.htm

Follow the Downloads link from there!

Cheers!

James

530. Still looking for TT or Falcon System

Newsgroup: comp.sys.atari.st
Date: 2000-07-15 00:00:00 UTC
From: phantomm@eastky.net
Message-ID: <8kp2n9$pv9$1@nd.eastky.net>
Source record: 59713

Got a friend who would really like to purcase a good Atari TT or
Atari Falcon system.

So if you got one you can part with do e-mail me the details on it
with price.

Thanks,
phantomm@eastky.net

531. Tina Turner Demo

Newsgroup: comp.sys.atari.st
Date: 2000-07-15 00:00:00 UTC
From: phantomm@eastky.net
Message-ID: <8kp2t4$pv9$2@nd.eastky.net>
Source record: 59714

I've heard alot about the Tina Turner Demo, but have never had the pleasure of seeing it.

Does anyone know if any Atari Hardware was used in making the Demo?

phantomm@eastky.net

532. Looking for the following hardware

Newsgroup: comp.sys.atari.st
Date: 2000-07-15 00:00:00 UTC
From: phantomm@eastky.net
Message-ID: <8kp3ad$pv9$3@nd.eastky.net>
Source record: 59715

Looking to purchase the following Atari Stuff...

1. A Falcon Video Genlock, wasn't there one made especially for the
Falcon?
Are there any other types of Genlocks that will work well on the
Falcon and other Atari machines?

2. Working or Non working Expose's and Screen Eye's.

3. Non working Falcons.

4. Migraph Wand/Flatbed GreyScale Scanners for Ataris.

Got some of this stuff, then e-mail me some details with price please.

Thanks,
phantomm@eastky.net

533. Best FPU's for use in a CT2B?

Newsgroup: comp.sys.atari.st
Date: 2000-07-15 00:00:00 UTC
From: phantomm@eastky.net
Message-ID: <8kp3js$pv9$4@nd.eastky.net>
Source record: 59716

Can anyone give me some advise on the best FPU to put into a CT2B Falcon. Like whats the fastest one that I would need?

Also, can someone tell me what difference does it make if you do the VGA Adapter Modification for the CT2B that the manual recommends? What will I gain by doing this modification?

Thanks in advance,
phantomm@eastky.net

534. Gem desktop pictures?

Howdy,

I am wondering whether there is any way to customize the Gem desktop with a background image, short of a replacement desk program... ie, can the desktop.inf file on boot floppy be edited to load up a background image?

I use a Mega ST4 without hard drive, so I'm looking for something that can be easily customised on the boot disk. Any ideas???

Thanks a lot,

Matthew.

I use an 68882-33 as long i have the CT2. Perfectly.
68882-16, falcon standard part, woni¿½t run.

> Also, can someone tell me what difference does it make if you
> do the VGA Adapter Modification for the CT2B that the manual
> recommends? What will I gain by doing this modification?

Modification allows to use the higher pixel clock from CT2 with falcon
standard video adaptor. Falcon video adaptor had pin 15 normaly
connected to ground. Also you can remove one smt resistor below
mainboard with the same result.

Pin 15 video port is connected via smt resistor R49 staight to pin 14
videl. If any video adaptor outside falcon pull down pin 15 to gnd also
pixel clock from CT2 goes to gnd.

Regards, Robert

From what I remember CAF as a whole cannot be sync'd to the sample (according to an old beta tester and Charlie S.) as MTC only checks its location every so many frames but the midi timing on a Atari is very tight so most likely you will not see any drift.

Your digital clocks are sync'd though.

I ran CAF with a Fostex RD8 (ADAT with a built-in sync card) also with a SoundPool ADAT digital interface and used MMC to control stop/stop on the RD8. Was it sample accurate? no but it was very damn close. (if I recorded the same audio on two tracks and inverted the phase of one the samples would not cancel.)

If you have a SMPII on both you could lock to SMPTE time.

All in all, its close enough.

Rich

Last Updated 07/15/00
- Sold Items removed

I have the following Atari ST components, software and manuals/magazines for sale. All the equipment is cleaned and detailed, and in good or better condition, but without boxes unless noted. If you have any questions in regards to unit condition, please feel free to ask.

All prices quoted are in U.S. funds with the buyer paying shipping. For items that I am taking offers on (no price listed), please make all offers in U.S. funds. I am also willing to trade for certain items, please see my list at the end of this post.

If you are interested in any of these items, please respond to Jim at jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.ST (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

Hardware Please make an offer
==========
- Atari 520 ST - with mouse but missing power supply
- Atari SC1224 Monitor 13" ST Color Monitor
- Atari PCT1426 Monitor 14" High Resolution TT/PC Color Monitor
- Atari SF354 3.5" Floppy Drive - with drive cable, no power supply
- Atari SLM804 Laser Printer - boxed with power supply and controller
- Atari Megafile 44 with built-in Tape Backup - with power supply and cable
- Atari Megafile 60 - with power supply
- Magic Sac 1 - Macintosh Emulator Cartridge (with manuals, but NO ROMS)
- Magic Sac 1+ - Macintosh Emulator Cartridge (with manuals and ROMS)
- Custom made Atari RGB/Audio cable. Connects an Atari ST to either a SONY XBR or XBR II RGB Monitor
- Best Data Smart One 2400X - External 2400 baud modem with power supply

Controllers Please make an offer
==========
- Paddles (multiple sets) - for Atari & Commodore units
- 2x Suncom Tac Joysticks - for Atari & Commodore units
- 1x Spectravideo Joystick with suction cup base - for Atari & Commodore units

ST Software Please make an offer
==========
- UltraScript for MEGA ST- by Atari (with manual & software)
- Ultra Script Type Collection - Packages 1-7 (Complete with box, manuals, & software)
- Macro Mouse - The mouse recorder (Complete with packaging, manuals, & software)
- Calamus Desktop Publishing (Complete with box, manuals, & software)
- Spectre GCR Mac Emulator with ver. 3.0 update manual (Box, manuals, software - NO ROMS or cartridge)
- Flash Telecommunications package (Complete with packaging, manuals, & software)
- Flash II Telecommunications package (with manual and software)
- Dungeon Master - by FTL (Complete with box, manuals, & software)

ST Books Please make an offer
==========
- Atari ST Volume One VDI
- Atari ST GEM Programmers Reference
- Atari ST Tips & Tricks
- Atari ST Internals
- Programmers Guide to GEM
- MC68040 32-Bit Microprocessor Users Manual - by Motorola
- MC68000 8/16/32-Bit Microprocessor Users Manual (eighth edition) - by Motorola

Manuals & Technical Guides (software status specified) Please make an offer
==========
The majority of the ST/TT manuals are of the binder variety
- Micro C Shell - by Beckemeyer Development Tools (without software)
- LDW Power Spreadsheet - by Logical Design Works (without software)
- Superbase Personal - by Precision Software (without software)
- dBMan - by Atari (without software)
- 1st Word Plus - by Electric Distribution (without software)
- HyperPaint - by Atari (without software)
- Easy Draw - by Migraph (without software)
- Regent Base/ Regent Base 2 - by Regent (without software)
- Publishing Partner Professional / PageStream -by Soft Logic (without software)
- Publishing Partner - by Soft Logic (without software)
- Touch-Up - by Migraph (without software)
- Microsoft Write - by Atari (without software)
- Codekeys The Macro Tool - by CodeHead Software (without software)
- Degas Elite - by Integral Solutions (without software)
- Brataccas - by Psygnosis (without software)

Trades
==========
I am also willing to trade for or towards rare or shrink-wrapped/sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems

- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- A working 6000 series Dish Network receiver
- A valid Dish Network card
- Valid DSS H or HU Cards
- And of course the ever popular, original Intellivision keyboard (should I be so lucky :)

I have a limited amount of brand new Atari Jaguar items for sale or trade (these are not refurbished units). These packages are ideal for new collector's or somebody wanting to start or add to their Atari collection. If you have any questions, please feel free to ask. I am also willing to trade for certain items, please see my list at the end of this post. All prices quoted are in U.S. funds with the buyer paying shipping.

If you are interested in any of these items, please respond to me by using this automated link jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.Jaguar (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

** Atari Jaguar Packages - Brand New (with controller, RF Box & AC adapter)**
==========
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $45
- Atari Jaguar with CyberMorph cartridge $35
- Atari Jaguar (No Cart) $25 - Only a couple left

** Atari Jaguar Accessories - New**
==========
- Jaguar unit alone (No power supply, controller or accessories) $20
- Team Tap (4 Player adapter) $25
- Composite Video Cable $15
- Spare Controller $15
- AC Power Supply $10
- RF Switch Box $5

** Atari Jaguar Games - New/Shrink-wrapped**
==========
- Checkered Flag $10
- CyberMorph $5 (No Box)

Atari Force Comics Please make an offer
==========

All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades

>I've heard alot about the Tina Turner Demo, but have never had the
>pleasure of seeing it.

It was totally gob-smacking at the time. Other machines were
struggling with 256 colours, then along came this amazing
demo which ran in 16-bit. Technically it didn't do anything
amazing, it was the fact that is was recognisable (in terms
of content) and was quite well presented. Its short length
and general loudness (sound and vision) made quite an impact.

>Does anyone know if any Atari Hardware was used in making the Demo?

Don't know. It's just a digitised video, and that could be
done on almost anything.

It says so quite clearly in the manual: 33MHz MC68882 in a
PLCC package.

>Also, can someone tell me what difference does it make if you
>do the VGA Adapter Modification for the CT2B that the manual
>recommends? What will I gain by doing this modification?

Your CT2 will work properly.

Note: This only applies for the original Atari adaptor!

Could also be a mail server problem! Here, it's happened with .94
and .96 but is very inrtermittant which would make it hard to trace
the problem down (I would assume).
This does happen very frequently here though (.94 & .96) with
NG dowloads. There's a delay before the whole file is received and
then just sits there but if I wait long enough or hit ESC the file
kicks in. All was OK with .94 for a while before the problem arose
so something must have changed on my NG server which Newsie
does'nt like!

>
> When saving preferences and other options the file select box
> appears with lower case letters.

A complaint of mine too. There are other file selectors that handle
lower case but I'd rather use the standard which only handles upper case
(just used to it I guess) and may have something to do with single TOS.
I manually take out the 'txt' and either add an '*' or a TXT which will
then show the list of files not shown with 'txt'.
Maybe John R. is evesdropping (:->)~

Everest works fine for me as an 'External Editor' and kicks in
automatically if 'EDIT' is clicked on before you send. Thanks to the new
'QUEUE' for newsposts I can take my time editing while my NG disconnects.
The next time Newsie re-connects, the first thing it does is
automatically send the Queued post. Great feature for slow typists!

John R. is also looking into adding an editor if enough people want it.
He's got a long list of items in 'IMPROVE.DOC' in the .96 package which
he asks feedback on + add suggestions.

>
>I won't carp. Basically it works, but it's a bit awkward. Thank you
>John for all your hard work. If you could fix the email bug I would

While I agree Thing is pretty good, I think he was asking about a
program that puts a picture in the background *without* a replacement
desktop. I suggested DeskPic, or WINX's background pattern program.
Does anyone else have any other suggestions I don't know about?

544. Dead SCSI on a TT

Newsgroup: comp.sys.atari.st
Date: 2000-07-15 00:00:00 UTC
From: jba4@po.cwru.edu
Message-ID: <3970d24e.21797862@news.cwru.edu>
Source record: 59727

ALright,everyone. Some of you may have read my previous problems with SCSI on my TT. Well, I recently acquired a copy of HDDriver to set up this system. I had a 120meg drive set to SCSI 0 and terminated inside the TT. Outside, I have another 120meg drive set to SCSI 1 with no termination. Next in the chain is a 8gig SCSI drive set to SCSI 2 and terminated with internal power to the temrinator (whatever that means. That is the full description of the setup.

Now, ealier today, I formatted and attempted partitioning the 8gig drive after booting to floppy. from the floppy, I ran HDDRIVER.PRG and it detected all three drives. I formatted the 8gig drive (all the others were allready configured) and partitioned it into 4 x 2000 meg partiitions and 1 x 660 meg partition. It passed the setcor test and all. Nect, I tried changing some options at wich point the system foze. Upon reboot, HDDriver loaded (detecting all drives), but like ealier the system bombed while loading GEM (2 bombs). THe auto folder is empty and there are no autorun applications set up.

Now I booted to floppy again, but this time, HDDRIVER.PRG did not detect the two external drives (one of the 120megs and the 8gig). Since then, it has not detected it. I can enter HDDRUTIL.APP and run a scan (I believe it's the option Auto-configuring...) which scans the busses for drives. My big SCSI and the little SCSI show up as there in the scan, but, as I said earlier, are not detected by HDDRIVER.PRG. Since they are not detected by the SCSI driver, I cannot access them through HDDRUTIL.APP to format and partiiton them.

Now I have checked the termination settings and all the hardware over and over again. I have removed the external 120meg drive and reset the 8gig drive to SCSI 1 with termination and attempted to detect it with the same results as described above. Furthermore, when I remove the external drives, the internal drive will still not boot and gives two bombs when entering GEM.

Does anyone have any idea what is going on here? I am absolutely fed up with this ridiculous procedure at this point and I need some help. If anyone has any idea how this works for setup, please help me! Thanks in advance!

I've been searching for a while now for a game put out by this company.
The game was called Sundog. I had it for my Atari 1040STFm and played it to the day my ex-wife got rid of the computer. (it was my first ever computer game)
I remember seeing it once for the PC but I hold no hopes of ever finding that. I know there is some sort of Atari emulator for the PC that will allow me to play the game on my computer (I hope)
Does anyone know anything about the Company or the people who programmed or worked for the company?
Interplay was not much help for me as they only provided Dungeon Master 2.
please help me before I slowly loose my mind. (too late?)

552. Nova + HDDriver 7.71

Newsgroup: comp.sys.atari.st
Date: 2000-07-16 00:00:00 UTC
From: michael@fastlane.net
Message-ID: <4DE29FC3B71F473F.D766ACA81F8B8188.3A865E9DE71670F5@lp.airnews.net>
Source record: 59650

All,

I'm trying to get HDDRiver 7.71 working with my Nova on an Afterburner 040. I've tried both 2.61 and 2.66 Nova drivers, with similar results: lockup as soon as the option to go into the Nova menu starts (before the countdown timer is displayed, but after the Nova screen has been turned on). This worked just fine with HDDriver 7.12.

Any hints?

Thanks in advance,

Michael White (michael@fastlane.net)

Yes I still have that game. I played it to death and am still thinking
about re-playing it since it is somewhat different. I do not know much
about the company FTL I found Dungeon Master II for the PC by them and that
was las thing I have seen them produce. Here is a website that is dedicated
to Sundog. You may find some answers there:

Source record: 59653

Hello,

Papyrus 8 has been a dream program for me. I love it except for one thing. I cannot get the user defined color option to work. All I get is mono images, not color. I am told by ROM that it could be my Nova card drivers. I think this to be true, because when I export a file to a html form, the colors appear there under Cab. I was told to fool around with the compatibility options. Are there any Nova/Hades owners out there that have gotten this option to work?? If so, let me know just how you did it. Thanks.

Dennis (it was Dennis, wasn't it?),

they don't. Mine runs on my PC. I'm trying to get it running under
Linux too, but thusfar no success. Been trying 2 versions, but somehow
one was installed, the other one I can't even get untarred. The
installed one runs but I can't see what it does. It uses the CPU for
99 percent, but AFAIK I never fetched the first datablock for it :-)

Chris,

I decided to remove the complete dir, saved the existing txt files
somewhere else and reinstalled: got a new block and it runs again. I
just missed one block and the time, well heck... Still wonder what's
caused it, probably something wrong with the outfile... I had a zero
byte one here, dunno whether or not that's regular? I had a resultfile
alright, but something must have gone wrong. It happened after
thursday/friday's server problems.

So far I have only 16 signed up on the list interested in purchasing a Jaguar mousepad.

If you are interested in one, and have not already e-mailed me stating you would like to purchase one, then please do so now :

ClintT@AtariVision.com

The price is going to be between $6-8 (that includes shipping to anywhere in the U.S. and a few extra goods possibly! :)

The numbers have to be bigger then 16 to get these moving, thats why I'm posting this now. The more of you that e-mail me wanting one,the faster the mousepads will be made and start rolling out.

Thanks,

Clint Thompson

There was a version that might have been able to run on an Atari, it was for
the an "hp" with a m68k running NetBSD, my theory is that a program written
for the m68k processor and NetBSD should run on any platform, whether it's
an hp or an Atari, Joe Mirando of "Team Atari" was going to try it, but
that client
has been retired now, and there seemed to be only one user, (who's done 189
units
over a year and a half)

Claggy.

The crash did not happen until I clicked on Dialler to load it and after
everything had loaded so I will try your procedure as soon as I have time
- these long summer evenings in the garden :-))

I have never needed 68000 mode so I don't use it, the only programs that I
have problems with don't like Magic or TOS 2.06. This is fine as far as
Magic is concerned as I can boot in TOS but a bit of a pain for the one
ACC that I used to use - Abbreviator - as it refuses to work whatever
flag settings I try.

Thanks again :-)

No I don't have any "no subject" headed posts. I've been getting a note
of the number(s) from Paul for those he has headed "no subject" and in my
case the number(s) just aren't there, e.g. say 17529 and 17530 show as "no
subject", the only way I can tell is when I check the list of .txt files
I'll have 17500 to 17549 minus 17529 and 17530. I'm downloading all
posts for offline reading.

>>John, are you aware of this and can anything be done about it ?

>4xx response to indicate a missing article.

I've only just remembered (doh) that I used to get "no subject" posts in
v0.88 (when I started newsgroups) until in v0.94, in the Preferences
Server Address, I changed the maximum timeout to 20 seconds and From Last
Character to 5 seconds, it's since then that I've stopped getting them.

>If you could send me a LOG file with an example of a missing article,
>or one that hangs and times out, I would be happy to look at it.

I doubt that my log file would be of any use to you in view of the above
John, but if you would like me to send it I will.

If you still have problems - email me and I'll send you a program that
will enable you to boot up with the hard drive off. You then switch it on
and access it hopefully, I find it very handy for the odd occasion when a
new program crashes the system for some reason. I use AHDI as well.

news:396e8c68.3468429@news.cwru.edu...
: Alright, I have a seemingly simple question. How can I force
: a boot to strictly ROM TOS or a floppy before any hard disk
: bootloaders kick in?

Alternative 1:
You can hold down the ALTERNATE or CONTROL key while booting.
Their function seems a bit different. IIRC the CONTROL key skips
really everything, ALTERNATE loads some stuff.

Alternative 2:
You can, mostly, turn on your computer first, with an empty
diskette in the drive, wait till the Desktop appears and then
you can turn on the harddisk. After that you can use a diskette
with a harddisk driver to get access to the harddrive.

Alternative 3:
A very risky variation on this theme is to turn on the computer,
wait for the Desktop, and then (carefully) put in the 19p
harddisk cable from your not yet turned on harddisk. Finally
harddisk is turned on and driver activated from floppy. Avoid
this procedure if any of the others work!

Hello Fellow Atarians.
Last night on TV i saw Bladerunner probable for umteenth time.
Still in the background shots we still had our famous Atari symbol. After this excellent film, they had a break down of what made the film unique, describing various techniques. Which got me thinking of the uniqueness of our own personal machine. I feel we don't need to try and stick our heads above a parapit. As long as the majority enjoy what are the best about your own individual machine. Everyone's eye is always drawn to flashy gimmick, but as long
as you know that you have a safe ground too return to, that is the part of enjoyment. of the
of seeing of Atari in the background.

>That is the full description of the setup.
Should not the chain sequence be terminated at the end
With my TT030 I did not bother with a internal SCSI just kept a External instead.
>Now, ealier today, I formatted and attempted partitioning the 8gig
>drive after booting to floppy. from the floppy, I ran HDDRIVER.PRG
>and it detected all three drives. I formatted the 8gig drive (all the

>foze. Upon reboot, HDDriver loaded (detecting all drives), but like
>ealier the system bombed while loading GEM (2 bombs). THe auto folder
>is empty and there are no autorun applications set up.

* The reason here is because the HDDriver.sys was not created and saved.*
So when you rebooted it it had nothing.
On the option try not auto configure Try this manually and check each option needed.

>Now I booted to floppy again, but this time, HDDRIVER.PRG did not
>detect the two external drives (one of the 120megs and the 8gig).
>Since then, it has not detected it. I can enter HDDRUTIL.APP and run

>in the scan, but, as I said earlier, are not detected by HDDRIVER.PRG.
>Since they are not detected by the SCSI driver, I cannot access them
>through HDDRUTIL.APP to format and partiiton them.

Try cold bootup as I remember with mine on warm bootup it doesn't clear
the system. allow all three drives to engage the start your computer up.

>Now I have checked the termination settings and all the hardware over
>and over again. I have removed the external 120meg drive and reset
>the 8gig drive to SCSI 1 with termination and attempted to detect it
>with the same results as described above. Furthermore, when I remove
>the external drives, the internal drive will still not boot and gives
>two bombs when entering GEM.

This is mainly because there is no boot configure. When or if you remove
the internal scsi drive you will have normal basic TT030. When you added

the harddrive internally the computer is asking for a boot sequence.
With mine TT the 2.1gb harddrive are kept outside and terminated at cdrom source.

>Does anyone have any idea what is going on here? I am absolutely fed

Hiya all,
ICD makes host adaptors which can connect many SCSI-1 drives to Atari st systems. check them out at www.icd.com. they can tell you what mail order dealers will have these to sell you. I have owned one for almost 6 years and its great. I have a scsi scanner, CD rom, and 4 hard disks on one of these and I wouldnt give it up for anything. Having a fast scsi HD is too good to miss.

Hiya,
I was in the process of ordering a high density floppy upgrade from him when his company dissapeared. first his local and 1-800 numbers went bust then his website dissapeared to be replaced but a company of the same name from new york soon after. I always had suspected he had financial trouble and simply went broke or closed down to avoid bankruptcy. The sitution I read about here sounds more like what TOAD did to us (thats a place I have a beef with since they stiffed me the last time I dealt with them).

Had? Is this drive removed? If not it probably should have the
termination removed from it. I am no SCSI guru but my internal
drive I think is considered the first drive in the chain and so
it should not be terminated. At least that is how mine is setup.

Hi,

dunno whether or not there are still SETI users around here (where da
heck is Gary Priest???), but I'm encountering something weird with
SETI:
last thursday or friday or both SETI wasn't reachable for sending in
results, but as from either friday or saturday it simply states
"Unknown Error -66" after connecting and that's it. It doesn't send
results (or has done so but it still displays "sending result to
server" and doesn't fetch new data either...

Anyone having similar troubles or am I the only one?

That's really not the answer I was looking for.
My CT2B works Great without that modification. 800x608 TrueColor
Mode and it Benchmarks the same or better than the Benchmark tests
that Centek Posted!

So if I do the mod, can I expect better than 800x608 TrueColor on
a SVGA?

I was wondering if there was ever a version of Games Workshop's Warhammer 40k game SPACE HULK ever done for the ST. I know there is a PC version and a version of a similar game SPACE CRUSADE for the ST.

Heck, for that matter, what other GW games and/or utilities were done for the ST? I figure Warhammer being from the UK and ST so popular there that there would be some crosspollination between the two. Thanks all.

Bonjour :)

I have released a new program called D-GEM. It's an embryo of a
Dungeon Master clone. Please read the doc, coz you must have
the original floppy disk of Dungeon Master (or Chaos Strikes Back)
for the copyright.

The program is now a sort of Minos game: walls, pits and stairs are
implemented. So find the exit ;-)

Download at http://www.multimania.com/nef (files/dgem010.zip directly, 140 Kb)

Well, well, well I always have thought that the monochrome colors of the
'user defined' color option was caused by the fact I'm using N_AES.
So this is not the case then.
Just like you my Hades is equiped with a Mach 64 card and yes I do have
the same problem.
I believe that Paul Williamson who has also a Hades but with an ET4000
card doesn't have this problem. Right Paul?
So it could be the card drivers indeed.

Sorry I don't have any clue what's is wrong but I can report that on my
Hades running N_AES/FreeMiNT STing 1.26 works happely. I only must make
sure that I don't use the special MiNT SCC.XDD. With this HSMODA
replacement I have the same problem as you. However if I use HSMODA 7
everything runs smoothly.

NO, four! (me, too).
I suppose that the Download path would be appropriate for extracting
attachments.

As it seems that this is a time for making wishes... the arrangement of
some Newsie's menu items has always seemed somehow illogical to me. So maybe
some shuffling of menus might make this application easier to use. I have
in mind the "File", "News" and "Special" menus all of which deal mostly
(but not completely) with setting-up and manipulating news-reading. To
the contrary, the "Mail" and "FTP" menus contain everything and only what
is needed for those particular activities. It would seem reasonable to me
to move "New group window", "Check new groups", "Get full groups",
"Subscribe" and "Unsubscribe" into "News" menu...

I have come upon a digital camera the documentation for which says that
it uses TWAIN protocol for communication with a computer. I am completely
unfamiliar with this protocol, and I know only what was written in
camera's docs: TWAIN is a protocol for communication with picture
generating devices such as scanners and cameras. So: is this protocol
to be considered as some sort of de-facto standard, and is there
any software for our computer type(s) that support it?

Hi Paul,
It happened this morning, I suppose thats not bad...first time in
16 days. There was a short hang, probably about 15 secs. This left me
with one left at the end, which I clicked on 'read for offline' again.

On checking the numbers out of 200 downloaded this morning, there
were no missing posts, just one duplicated.

This mod has no effect on the CT2 performance. If you have the original Atari VGA adaptor block that plugs into the back of the Falcon, it won't work with the CT2 installed. I use the Chro-magic VGA/RGB switchable adaptor, and the mod is not necessary.

I have (or had, I now have an Eclipse) the same hardware, and my
experience is that no HD-Driver since 7.12 can be booted without some
problems. I now boot with a minimal HD-Driver (no caches, IDE 0 only)
7.12, and put a fully configured 7.8x in the autofolder. This works very
well, I haven't noticed any problems with it so far.

I can't say, I have actually never seen an original TT PSU as mine came
without one.

> understand that I can use a PC power supply too right? Any comments and
> suggestions are very welcome. Thanks.

Any *AT* PSU is plug'n play, but if you want to fit it internally you
might have to look a while to find one small enough. ATX PSUs needs
rewiring to work. I found instructions on how to do this somewhere on
IBM's website.

Hi Martin,

I am not exactly sure which user defined color opions you mean. If you
mean the Display Colors option (options menu) then this works fine for me
under Mint, Single TOS and Magic. I can also import a picture without
any colour problems, so all seems to be working fine here.

It looks from Edward's query as if he can't load a picture and display it
in colour and I don't think that is affected by the Display Colours
options menu.

I think it is a shame that the ruler icons only display correctly in
colour under Magic. Can this be corrected Ulli ?

Cheers

Paul

In that case I don't know. If it works, leave it.

>So if I do the mod, can I expect better than 800x608 TrueColor on
>a SVGA?

No. You're doing very well with 800x608. I can't get any lower
than the next one up from 640*480 before my Multiscan loses
sync because the scan rate is so low (it must flicker like hell
at that resolution - 60Hz in the standard Falcon modes is just
about tolerable if I sit at the right distance).

Did you look in the semiconductor section specifically?
You could also try General Instruments, which made the
same chip under the name of AY-(something... 8192?).
That's why you sometimes see the PSG referred to as
GI rather than YM in some sound programs' output selector.

The standard TT and MSTe PSUs (they are identical) are universal i.e
they cover 100-250 volts, 50-60Hz.

ST PSUs are voltage specific. I don't know about the Falcon's PSU.

>Make that '93-'94 and you're about right.

Well, you almost had me agreeing with you until that last line.
Now I'm skeptical (and had never heard of SPECmarks before). My
25Mhz 040 Mac dates from late 1993 to early 1994 and although
the Pentium 60 did debut in 1993, it was incredibly expensive
and rare until late 1994. Come to think of it, the Falcon
itself dates from 1993, though it's really earlier technology.

By your own data, the Milan II should run roughly 10x a stock
Falcon. I can live with that.

Mine is not terminated like that for ages, but the chain works fine.
This is one area often confusing, as there is also terminating
resistor packs on the mother board.

Pity there is not some good block diagrams which show
all the possible drive combinations in a clear fashion.
Like I say mine works, so I do not require further clearification.
If it ain't broke don't fix it way of thinking. ;-)

You might try Flash 32.
http://perso.infonie.fr/chass/

Imagery, for Mac users.
http://www.vargr.com/imagery/imagery.html

There are a variety of commerical programs that also work. I
use Imagecopy 4 on the Atari. Debabelizer on the Mac in another
which would work.

Methods 1 and 2 will both work fine. Note that I always wait
for the first sign of life from the computer before I press the
Alternate key (which is supposed to signal booting from
floppy). Method 3 will, in time, destroy your HD port and must
be avoided.

Although ICD did make a good adaptor, they do not appear to send out product nowadays (note careful wording). Ordering a similar cable from Europe might be a better idea. Alternatively, you might find an Atari dealer with an ICD adaptor in stock.

Try www.myatari.com for more information.

Gamer,

I installed STING 1.26/DAILER 1.17 on my TT and it worked good,
except when in a big web site like Yahoo or Ebay and moved around
to much I would get 2 bombs & 68 or 69 error, or sometimes it would
say "program refused to except data". So I went back to STING 1.22
which seem to be rock solid....

Try copying your old working DIAL.SCR into the new DIALER and see
if that helps the "initialising link" problem....

Later, Donner.....

Both ends of the SCSI chain have to be terminated. The TT's internal
drive is always at one end of the chain, i.e. it must always be
terminated.

Dosn't the manual say "-e" or "--english"? In case it says "--e" it's a
typo. I will check this.

624. GNU and .o file help needed

Newsgroup: comp.sys.atari.st
Date: 2000-07-17 00:00:00 UTC
From: Janka Gerhard <gerhard.janka@siemens.at>
Message-ID: <3972BA78.54B3EF4B@siemens.at>
Source record: 59678
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st

Hi,

I'm working at a GNU project and have the problem, that my environment
generates other .o files than the one of other people working at the
same project (a800 emu) and the result of my compilation does not
work while the others do. For the Atari platform we agreed on GNU C
2.91.66 and GAS 2.9. The first things when we tried to synchronize
were bin/gcc and bin/gas where I gave up my slightly newer versions.
Then I took over the include directory. That too didn't help.
Does anybody have an idea what other files would be needed for exact
synchronisation so we could be sure to create exactly the same
programs ?

Thanks
Gerhard

Message-ID: <3972DBF4.E46EFBF5@patent.gov.uk>
Source record: 59681

Hi Edward,

re your point about importance of good software and support. I run the
following on my Milan 1:

Graphics: Photo line 2.3 ..... PhotoShop look alike of 5 years ago and
not being updated (as yet)
Spreadsheet: Texel 2 ..... Excel look alike of 5 years vintage
Word processor: Papyrus 6 ..... Takes a different approach from
WordPerect 8 and as a result, for what it does is much easier to use.
Browser: CAB 2.8 ... on the Milan as fast as Netscape, but no Java
virtual engine so Graftool breaks in when Java encounted.
DTP: DA's LayoutTC ..... excellent and being supported Xplatforms.

Apart from some notable exceptions, the software picture is one of just
adequate software in all departments, some 2 to 5 generations behind the
PC/Mac equivalents.

On the MkX C-Lab Falcon my son runs Cubase Audio Falcon and I run Logic
Audio on my Falcon, both superb programs but again no longer supported.

Unless by some miracle, the software companies can be convinced of
1,000,000's yes I said millions of Milan 2 sales, they are not going to
divert facilities from PC/Mac software to Milan, but without such
uptodate software, the new computer byers are not going to 'go Milan'.
It's a vicious circle of hard money driven market logic. I am not
talking present Atarian's, like you and me, we are committed (or should
be :)), but about the great mass of don't knows.

Bob King.

Hi Stephen,

just to add to the story of the uniqueness of the Atari family, in my job of determining the degree or otherwise of inventions, Atari software and hardware has been used against some very big companies indeed. Notably the 8-bit Atari Artist tablet and cartridge against the market leaders in pre and post-production TV graphics and Tom Hudson's 3D-CAD suite against market leaders in 3D CAD. The GEM desktop has been cited against many 'new' GUIs. The Atari got there first in many areas, but sadly that was then and this is now.

Bob King. (GB)

Source record: 59686

I'm bringing a TT to Canada from Finland. The problem is the power supply. In Finland the power is at 220 volts and in Canada it's 110v. Does the TT have a switching power supply? Or do I have to install a new one. I understand that I can use a PC power supply too right? Any comments and suggestions are very welcome. Thanks.

Joshua.

633. Desktop pics revisited....

Newsgroup: comp.sys.atari.st
Date: 2000-07-17 00:00:00 UTC
From: Matthew and Caroline Simpson-Morgan <mcsm@rka.com.au>
Message-ID: <397304A3.C528558B@rka.com.au>
Source record: 59687

Hello,

I posted earlier about ways to get a picture onto the gem desktop - thanks for the responses there. Now I've found such a program to boot in the auto folder on a floppy; only problem is, it requires a degas .pi3 image for displaying.

The problem with that is that I want to work on an image on my PC first, then get it into degas format to load on the atari. I can't find any programs that convert gif or even .img files into degas. The only one I found that works only loads degas and saves degas, which means I have to draw the image by hand (mouse) and that's a little tricky when it ain't Photoshop!

I downloaded Degas Elite, and it bombs out the system and resets (MegaST4), won't even get up and running... not sure why that is. I'm not sure if that would load another format and save it as degas either.

So, if anyone can steer me in the direction of a program (atari or windows) that will convert an img or bmp or gif or whatever into Degas .pi3, I would appreciate it.

Thanks a lot,

Matthew.

634. Re: Astronomy programs

I have seen this before, in fact I probably have a board or two laying around,
if I didnďż˝t trash them jut the other day.
8048 on the board is microcontroller which takes care of generating some signals
that old floppy is too dumb to give by himself.
IIRC itďż˝s diskchange or something like that.
On the second glance i think that my version of the board doesn't have "modern"
34-wire version of the cable, just old multicolour bunch of wires that goes to
weird floppy connector for old drive.
It looks like you can just plug in the new drive on the new cable, take power
supply from white 4-pin connector (almost 100% of the time you don't need 12V,
so don't bother with it), persuade the PC drive to respond as drive0, cut some
plastic to fit it in and that's all.

OTOH, If you are a bit on mazohistic side, you could connect new drive almost
directly to the external floppy connector (that round black thing that round
floppy cable goes to).
That way you save 0.2W of electric power and your floppy becomes Green Star
Compliant Plug-and-Play peripheral :-)

BTW: I don't think that binaries are allowed on this NG.
It would be good idea that next time you offer to email such material to
interested parties instead of poisoning the globe with picture material of
non-porno nature ;-)

Regards,

Branko

I have been trying to purchase a copy of Magic for my Falcon and MagicMac for my Mac for over a year now.

My emails to System Soultions are unanswered and they have not returned the emails of dealers I have contacted.

Does anyone out there know where I may be able to purchase this in the United States?

If I can not purchase it, does anyone have a copy they would email me?

I would however much rather purchase...

Thanks,

John Clausen

clipped the rest !

John, I have been trying out 0.96 for myself on my Hades. At first it crashed on some menu entries and also when re-sizing the windows. Since editing the prefs.inf file to add the NNNNNNNNN to the "experimental" line it had been very stable. (This is under Mint/N.AES - under Single TOS it worked fine anyway.)

BTW I am running WDIALOG 2.04 so I won't try to edit nicknames :-))

Anyway, on the <no subject> messages, I have just downloaded the same 10 articles from a woodworking newsgroup into both 0.94 and 0.96. The log file shows....

-> article 520275
430 No such article

...in both of the logs. I had the same timeout to wait for in both 0.96 and 0.94 and the <no subject> message appeared the same in both.

Unless there is something I have not set properly in 0.96, it seems as though the problem has not been cured for me, although Trevor Spencer seems to be doing rather better !

If you would like copies of my prefs.inf file or the full log, let me know and I'll send them to you.

Cheers

Paul

There are three ways available.

1. use an transformer 110 -> 220V
2. replace internal psu with an 110V type (best electronics)
3. remove internal psu, connect pc psu
(and watch all psu connections!) board goes smokey if anything is wrong)

Mainboard
TT Description/Voltage

1 PG (PowerGood)
2 +5 Volt
3 +12 Volt
4 -12 Volt (serial!)
5 GND
6 GND
7 GND
8 GND
9 -5 Volt
10 +5 Volt Mainboard
11 +5 Volt Mainboard
12 +5 Volt Mainboard

Hope thats correct. No warranty. Use an volt checker.
Do not connect anything to some else if you doasnï¿½t knew for what it is!

DOIT_ST v3.2.2 contains colorised schematic you need. Click to TT PSU.
Text is german but you can use all drawings.

It has nothing to do with picture but with rasters (?). He is talking
about the menu 'graphic/Object properties/color. Here you can choose
between basic color and define color.
The define colors are monochrome.

>I think it is a shame that the ruler icons only display correctly in

>I�m concerned about objectivity of SPec95, at least regarding MC68K

Spec95 is a test suite, not a person/group, so it's of course objective (well,
it doesn't really have an opinion at all ;-).

The really good thing about the Spec suite is that it's available to anyone
(it costs money, though, so you won't find many private persons running the tests),
so improved hardware and compilers can be tested at any time.

Since the test is fixed (it consists of a series of applications, running from
GCC compiles via games to heavy numerical computations), you can compare any numbers
to any other.

>machines,
>as there are a few illogical figures in your table:

Well, it wasn't my table. ;-)
Feel free to locate 'better' numbers on the net and show us. With something like
SPEC that is (unlike for 'MIPS') possible.

>> >CPU/MHz Int Float
>> >68000/16 0.14 0.16

>>
>
>1. How can 030, working at 33 MHz be only 3-times faster than 000 on
>16MHz ?

Does seem a bit low, but we don't know anything about the rest of the hardware
for these machines. I would have guessed at a factor of 4-5 or so.

>I think that for 000 one can say that it achieves 10 cpi average on
>"usual" code
>and 030- should be in 2-3 cpi range IIRC. Not to mention fully 32-bit

Uhm, no. The very best the '030 can do is two cycles, and that's for simple
instructions like add, etc. For the same (as long as they are only 16 bit), the
68000 usually takes 4 cycles. Anything involving memory takes more.

>>From float readings, one might suspect that both systems were without
>FPU, since the same performance ratio applies.

I'd rather assume that the 68000 in question has a 68881 connected.
The '030 number is far too high compared to the other machines otherwise.

>> >68040/40 1.16 1.31
>
>Logical speedup-looking at integer tests, but how can 040 be only 2.5-x
>faster
>than 030 at FPU stuff, given the fact that 040 HAS an FPU unit ?

The '030 must have been using an FPU as well, and note that real world FPU
calculations (like the ones in the Spec suite) are usually very heavy on uncached
memory accesses.

>Obviously, FPU was not used and so this test does not represent fully
>speed of 040.

There is no way an '040 could be within a factor of two of a PPC603e/166 without
using the FPU (the 603e/166 gets 3.9/2.5 according to the same table). Also, the
'040 number is higher than the reference - a SuperSparc/40 (used in Sun workstations).

>> >68060/66 2.18 2.33
>>
>
>060 should give higher results here in both tests.

I really doubt that, but as I've said, please feel free to locate higher numbers
on the net or somewhere else.

>Integer test is low, because 060 has TWO enhanced 040 integer units
>instead of only one in 040. Seems like system didn't use second unit.

I think that's extremely unlikely. People who take the trouble to get hold of and
run something as extensive as the Spec benchmark aren't too likely to make such
fundamental errors (and if there is indeed a need to turn anything on, the OS should
have done it).

>Same as before goes for FPU test, FPU unit has obviously been sleeping
>through entire test.

Absolutely not!
(But try to locate some other numbers if you think otherwise.)

>> >486DX2/66 0.74 0.50
>> >P5/60 1.73 1.45
...
>No special coments regarding Wintel.

Why not? ;-)
The 486/DX2 number looks awfully low (some Spec92 numbers I found put it at about the

same speed as the '040).

> would just say that these tests reflect many other factors than purse

Take a look at www.spec.org if you want to learn more about the Spec suite.
Memory and external cache (speed and size for both) is certainly important too,
of course. Unless you have so little memory that you start swapping, or have a really
bad HD, the rest of the hardware shouldn't matter.

>CPU performance. It seems to me that on all 68K machines was used the
>same old compiler, meant for old 68000, whereas that would be hard to

Even if that was the case, it doesn't really matter a whole lot.
I seldom bother with turning on '030/'040 optimizations in gcc, since the difference
is marginal.

>believe for Wintel platforms, where one just use the latest version of
>the stuff that does instruction optimization specially for
>Cyrix/AMD/Intel/Whatever...

Traditionally, the x86 compilers haven't been terribly good (horrible architecture!)
and I'd be surprised if anyone has rerun the tests for the old machines with the
latest compilers. Anyway, the processor makers take SPEC very seriously and do what
they can to get good numbers on it.

Sorry. I meant that given results probably don't reflect pure CPU performance, as they seem to be clouded with interference of the systems that those CPUs were fitted in. Off course, each benchmark only shows us CPU speed on the given code...
One might argue that this is actually real speed as one depends on the whole system and not only CPU.
Still, arguments were made regarding CPU speed, not system speed.
(As "68060/66 is comparable to Pentium I/90" etc).

<SNIPPED>

That's what I was talking about. 030 system seems to be poorly/economically designed. I sometimes think that MC made 68K stuff a bit too good, so designers could often cut corners and still get away with it. IIRC Atari TT (which was so praised and expensive)

DOES NOT HAVE L2 cache (at least not one worth mentioning). In Wintel world, with stunt like that, competition would eat them alive.
They would probably become reference for everyone else, so that they could claim their L2 boards as "Double Speed", "Quad Speed" etc...

IIRC 68000 takes four cycles only for NOP and more or less anything that operates on registers only, that is 16 bit wide and that do not have additional parameters within instruction... Everything else takes more, up to DIVS, which can take some 140 cycles. Usually the average is much higher than 4 cpi...

>
> >>From float readings, one might suspect that both systems were without
> >FPU, since the same performance ratio applies.
>
> I'd rather assume that the 68000 in question has a 68881 connected.

Even if 68000 had a FPU, one would expect that software handler for FPU communication would cause considerable additional slow down.
OTOH, maybe "grandpa" was tested while on viagra :-)

> The '030 number is far too high compared to the other machines otherwise.

I guess it depends on what's in a test. 030 is the fastest combination with full-instruction set FPU. Everything newer (040 and up) has simplified FPU that needs CPU assistance to execute complex instructions...
Thanks for the URL. I'll take a peek at the source code when time permits...

>

As said, FPU unit in 040 is different than 68881/68882. It does lack many instructions, which have to be emulated. OTOH, new FPU unit is on the die, on the other side of the internal cache and FPU transfers shouldn't bother CPU nearly as much as with 030/68882.

One would expect to get FPU speedup totally different than CPU speedup.

Wasn't 603e cheap version without FPU?
I'm not sure about this, I'll have to check, but I know that 603e was degraded in some
way, compared to 603...

I'll take your word for it. I never did designed anything around 040, so who am I to
speak... But I did my fair share of 68000 designs with some to come.
On the secon thought, maybe I should send a buck or two to those Spec guys.
Their results on the 68000 make me feel young :-)

Because I have never done anything with 386,486 and the like except nice badges from the silicon die ;-)
I don't know much about x86. I have tried, but their 1-page datasheets are BS
(all saying "We are the best-that's all you need to know")

>
> The 486/DX2 number looks awfully low (some Spec92 numbers I found put it at about the

>

Something that fits in the cache of small Celeron's only 128 Kb cache doesn't necesarrily fit in the awesome 8K cache of 040, and then the rest of the hardwarematters a whole lot, mainly external L2 cache speed and memory speed, usually in this order of importance...

>

Maybe also because it wouldn't be of particular interest to anyone to use some new fancy compiler in order to increase speed figures of old 486 system. Much better is to apply it to new things and let them shine more :-)

Regards,

Branko

This still looks like a termination error, and Uwe and Martin
appear to be giving good advice.

One thing I'd try is to get the TT running with just the
internal drive. Then pull the resistors (i.e. terminators) as
mentioned by the others and get back to work on the 8 Gb drive.

648. FS : SuperCharger

Newsgroup: comp.sys.atari.st
Date: 2000-07-18 00:00:00 UTC
From: Optik@btinternet.com
Message-ID: <3974c56f.2483034@news.btinternet.com>
Source record: 59552

Would anyone on this group be interested in a 'Supercharger' for the
Atari ST.

Hopefully you know what one is?

It is complete with manuals/software + PSU and cables to link to PC
etc.

Please email me for more information or to make an offer?

Thanks

>(As "68060/66 is comparable to Pentium I/90" etc).

I agree. It seems the specmark is a way of measuring the CPUs power,
not a whole computer. How have they achieved this?

A lot of people seem to think that a computer that
has the fastest Mhz is the fastest machine - they're just
ignorant.

I can accpet that a 060 @ 66Mhz has similar grunt to a P90. P90
machines probably have their memory at 33mhz don't they, whereas
the Milan II will have it storming along at 66/80 mhz.

Doubling the STs CPU gives a measly 120% speed increase overall,
whereas doubling the clock can give far more.

They also have to take the OS into account, I know which one's more
efficient out of Windows and Magic..

I would say bus/memory speed is a lot more important than CPU speed.
Leave that "1Ghz" crap to the sales people at PC World.

>Even if 68000 had a FPU, one would expect that software handler for FPU communication

651. Creating real ST Disks with a Mac?

Newsgroup: comp.sys.atari.st
Date: 2000-07-18 00:00:00 UTC
From: Alexander Klock <alex@alexanderklock.de>
Message-ID: <3974CC64.48FC9B0F@alexanderklock.de>
Source record: 59555

Hi there,

I wanted to use DUST on my Macintosh to create some real ST readable
Disks out of some Archives from lgd.fatal-design.com.

Unfortunately the Disks don't work, either the disks seem to be corrupt
or the images are too large for the disks.

Is there another way to create real disks out of images with a mac?

Thanx
Alex

652. 100k Hits - magicos.de

Newsgroup: comp.sys.atari.st
Date: 2000-07-18 00:00:00 UTC
From: Bengy <bengy@home.com>
Message-ID: <B59A2B4B.40F0%bengy@home.com>
Source record: 59556

After I posted the arrival of 100 000 visits to magicos.de a few weeks ago, some programmers and organizations emailed me offering to help "celebrate" the milestone by donating some small gifts, so now...

We've teamed up with ST-Computer Magazine and various shareware programmers and organizations to be able to give loyal Atari users a chance to win prizes. "Celebration 100K" is a way of thanking all of our 500+ daily visitors and supporters. How to enter?
1) When you see the counter (Thanks to Atari.org) reach:
115 000
Then take a snap shot of the webpage (showing the counter), sign the guest book, and E-Mail me to see what you won!
Do the same when you see:
135 000 and 1 55 000
(Access.logs will be checked: Reloads will be disqualified! If the counter says 114 999 for example, Im sorry but you can not reload the page to win!)

2) Other mini contests will be announced as time goes by, so stay tuned!

Special note to programmers and organizations: If you would like to be very nice and donate a free registration, a gift certificate/voucher, then don't hesitate to e-mail me! You can even design your own mini-contest!

(note: This is a celebration of MagiC Online and is independent from the upcoming Atari Competition in conjunction with the Place2be. The upcoming competition will be much larger and should spark lots of activity in the Atari community)

Magic online: http://magicos.de

Yours, with sympathy and all blessings,
Bengy

| > possible drive combinations in a clear fashion.
|
| Have a look at the NetBSD/Atari port's FAQ.
|
| http://www.netbsd.org/Ports/atari/faq.html#term
|
| The general idea is this:
|
| ^^--internal---------^^--||-------external--^^
|
| ^^ = terminators
| || = DB-25 external SCSI connector
|
| The SCSI chain is a straight line, and there must be resistors
| at both ends. One end is always the internal drive, and must be
| terminated at all times. This is the simple part.
|
| The complicated part is, either:
|
| 1) The other end is not used, in which case you should insert
| the resistor packs inside the TT, at the location marked on
| that NetBSD/Atari FAQ.
|
| 2) The other end _is_ used i.e. there are devices connected on
| the external SCSI connector, in which case you remove the
| internal resistors and instead terminate the last external
| device of the chain.
|
| In both cases, the TT's internal drive is always terminated.
|
| What changes is, the other end is terminated either near the
| DB-25 SCSI connector inside the TT, or at the last external
| device of the SCSI chain.
|

Hi Bruce,

I'm letting go of my Centurbo II equipped Falcon. My asking price may be too close to your retail price for you to be interested. It has 32MB TT RAM, 14MB ST RAM, FPU, and 550MB internal IDE hard drive (w/o cable). CT2 CPU clocks at 50MHz. Asking $700. Also could include 2GB external SCSI drive in SF354 case, MediaVision Reno SCSI CD ROM, SLM605 with Falcon Heatseeker SLM interface.

No no no! The Spectre will not run on a Falcon. The Cart port is
different. Dave Small had hoped to make a Falcon compatible Spectre, and
support Falcon color, but it never happened. Neither did 3.1 make it out
to the public.

>Papyrus 8 has been a dream program for me. I love it except for one thing.

How do you get on with some of the dialog boxes? The one which comes up offering to change styles has buttons so wide that it forces the dialog box off the side of the screen. The printer dialog has a remove <something> button where the shortcut hasn't been moved to a suitable letter, so it's ALT-Space. The text for the object of the "remove" command isn't complete in the button.

Bit messy, I'd say.

That's a standard used for the PC. It allows programs to load or scan images
straight into their windows for further manipulation.

The nearest alternative on the Atari platform is GDPS, a scanner driver protocol
which allows scanning straight into programs such as Alexander Clauss' OCR,
PixArt, and Calamus.

662. Misc Atari Items FS/Trade/Wanted

Newsgroup: comp.sys.atari.st
Date: 2000-07-18 00:00:00 UTC
From: Fred Horvat <fmh@oh.verio.com>
Message-ID: <3973A67A.4831DE2B@oh.verio.com>
Source record: 59625

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. E-Mail me or call me at
440-286-2567 evenings EST. I am also open to trade offers.
E-mail me your list to fmh@netzero.net

My want list is near the bottom of this list.

HARDWARE

I have a real gem here. The only known stand alone Atari 2600
computer system made. The Bit60 Computer made by Bit Corp.
Spectravideo made an add on adapter for the 2600 console.
This is a fully functional computer and 2600 game system.
This is the 2600 computer system reviewed in
"The 2600 Connection" issue #30 Sep/Oct 1995. I am pretty
firm on the price since this is not something your going
to find at a local flee market or garage sale. $1,000.00

Falcon Speed by Sack Electronic
Intel 286-16mhz IBM processor board for the Atari Falcon computer
Run DOS and Windows 3.1 programs on your Falcon
Norton SI Factor of 12
Sound Support
Up to 8 Meg of IBM RAM
VGA and SVGA video modes 640x480, 800x600, and 1024x768 under Windows
3.1
Switch back and forth between TOS and DOS modes $100.00

Spectre GCR by Gadgets by Small. This is the Apple Macintosh emulator
for the Atari ST/STe/TT/Falcon computers. Includes cartridge, disks,
box, and an extra disk of misc ST utils. $40.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 as a stand alone fax machine.
Comes with special fax modem, diskettes, and manual. $30.00

Apple Powerbook 165. This machine runs MagiC Mac real fast.

Can even browse the Web with CAB! 68030 33mhz, 8 Meg RAM,
80 Meg Hard Drive, Running Mac OS 7.5, 9600 baud internal modem
640x400x16 shade grey scale display, Battery.
Comes with nice Targuus carrying case, Mac OS 7.5 for Dummies book
Internet Starter Kit for Mac book with CD-ROM.
I have Internet dialer software setup and working with a couple
of different browsers installed. With the 16 shade grey scale
screen it is not too bad to browse the Web with. $150.00

GAMES

Imperium Game manual and registration card from Electronic Arts.
I no longer have the disks or box but for someone who needs
the docs here you go. $1.00

Conquest of Camelot by Sierra. Complete with box, docs, and disks $8.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $8.00

Plan 9 From Outer Space by Gremlin. Complete with box,
docs, and disks.
$12.00

MISC SOFTWARE

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Includes box and diskette
no manual. $5.00

BOOKS $5.00 each unless noted

Compute's Technical Reference Guide to Atari ST TOS Vol 3.
Includes fully commented C and machine language examples. $5.00

Thunder! The Writers Assistant manual. $1.00

MAGAZINES

I have a large selection of mostly 80's and early 90's Video Game and
Computer Magazines, Books, and Newsletters for various systems.
Please E-mail me for a current listing.

WANTED

MagiC Milan Ver 6.1X
MagiC Mac Ver 6.XX

CAB 2.7 or higher, full version or upgrade
AIXIT TT RAM board
MagiC Ver 6.XX for Atari, full version or upgrade
NDVI 5.XX full version or upgrade
Atari Jaguar Battlesphere

OTHER Platforms

I also have lists of software for other platforms like IBM, XXX CD-ROMS,

OS/2, and Amiga. If interested please request a list.

I may be thinking about something completely different, but I remember there being a plug-in computer module for the 2600 in the early '80s that sat on top of the main unit and had a small rubber-keyed keyboard. I saw it in catalogs for a while, so if this is the same thing, I'm sure it's not the only one. At any rate, I've seen something similar before. I thought it was quite a cool idea at the time (although I was in elementary school, so... :)!

>Spectre GCR by Gadgets by Small. This is the Apple Macintosh emulator
>for the Atari ST/STe/TT/Falcon computers. Includes cartridge, disks,

And as far as I know, the Spectre GCR cartridge is NOT for the Falcon, as the Falcon (stupidly) uses a different cartridge port design than the ST(e)/TT computers do. Just thought I'd clarify in case someone with only a Falcon is interested.

Ok, eveyrone, I've made a little progress. I loaded CBHD onto the internal C: partition. This partition was not reformatted at any point since I want everything on it. Now I can get CBHD to start from hard disk and detect my external 8gig drive. Next, BiGDOS in the Auto folder executes (this is the only ting in Auto). THen the bumble bee comes on and GEM goes down with two bombs. The desktop never comes up.

Now booting from floppy, I can run CBHD and install all the hard drives (including the 8 x 1 gig partitions on the 8gig drive). I do not run BigDOS from floppy as that will lock the system. Next I can access the internal partitions. I removded and saved a sterile Newdesk.INF file to insure programs were not causing GEM to bomb and renamed all the accesories to insure nothing loaded. Rebooting with this setup causes GEM to bomb with 2 bombs before it even comes up to the desktop.

Finally, I removed BigDOS from the Auto and REbooted, which caused, as expected, GEM to bomb at start.

ANd just as an end note, removing the 8gig drive and booting the HD with CBHD (or HDDRIVER) still causes GEM to bomb at startup.

Now the 8gig drive was partitioned using HDDRUTIL, not CBHDCONF since CBHDCONF cannot seem to understand that the drive has an 8gig capacity. However, I cannot use HDDRIVER with the system since it still refuses to detect the 8gig external drive at all.

The drives are not using parity (the internal drive doesn't work with it). tHe internal drive is terminated, as is the external drive. tHe internal drive has always been terminated and used to work. The internal drive is set to SCSI ID 0 and the external 8gig is set to SCSI ID 1.

I am completely out of ideas. Does anyone have any idea how to salvage this system? I'll do anything to get it running. THanks in advance! And thanks for all the help so far!

Iďž˝m concerned about objectivity of SPec95, at least regarding MC68K
machines,
as there are a few illogical figures in your table:

> >CPU/MHz Int Float
> >68000/16 0.14 0.16
> >68030/33 0.42 0.49
>

1. How can 030, working at 33 MHz be only 3-times faster than 000 on
16MHz ?
I think that for 000 one can say that it achieves 10 cpi average on
"usual" code
and 030- should be in 2-3 cpi range IIRC. Not to mention fully 32-bit
ALUs, which mean no speed penalty for 32-bit instructions etc.
>From float readings, one might suspect that both systems were without
FPU, since the same performance ratio applies.

> >68040/40 1.16 1.31

Logical speedup-looking at integer tests, but how can 040 be only 2.5-x
faster
than 030 at FPU stuff, given the fact that 040 HAS an FPU unit ?
Obviously, FPU was not used and so this test does not represent fully
speed of 040.

>
> >68060/66 2.18 2.33
>

060 should give higher results here in both tests.
Integer test is low, because 060 has TWO enhanced 040 integer units

instead of only one in 040. Seems like system didn't use second unit.
IIRC it has to be enabled after reset through special flag. 65% of speed
increase is due to the higher clock, so there is only 13% speed increase
in cycle terms. This could be due to larger cache on 060 or more likely
due to enhancements on the integer engine.
Same as before goes for FPU test, FPU unit has obviously been sleeping
through entire test.

>

No special coments regarding Wintel.

I would just say that these tests reflect many other factors than purse
CPU performance. It seems to me that on all 68K machines was used the
same old compiler, meant for old 68000, whereas that would be hard to
believe for Wintel platforms, where one just use the latest version of
the stuff that does instruction optimization specially for
Cyrix/AMD/Intel/Whatever...

Nevertheless it's wrong. Just have a look at the SCSI standard.
Regularly users report problems that are caused by not correctly
terminating the bus.

> This is one area often confusing, as there is also terminating
> resistor packs on the mother board.

What's confusing about this? Both physical ends have to be terminated,
the rest must not be terminated. That's it.

Since HDDRIVER when started from a floppy recognized this drive but it only wasn't recognized when booting HDDRIVER from hard disk I can't imagine any other source of error than not having configured HDDRIVER.SYS with the SCSI ID of the missing drive.
HDDRIVER.PRG as you find it on the driver disk checks any device ID since it is preconfigured this way. But the version you install as HDDRIVER.SYS has to be configured for most devices. Simply use the "Auto configure" option for this, as explained in the manual.

> The drives are not using parity (the internal drive doesn't work with

This doesn't matter anyway since the TT and Falcon support parity.

> it). tHe internal drive is terminated, as is the external drive. tHe

> SCSI ID 1.

Did you remove the resistors on the mainboard? You have to when an internal and an external drive are connected. Don't be confused by some people telling you that termination might not be important since it worked with their machine even if it was incorrectly terminated. Wrong termination can lead to weird problems and you simply have to ensure that everything is correctly terminated.

Hej Claes,

well, the problems have been solved meanwhile. Also meanwhile I
fetched the 2.04 client. I seem to recall the docs state "it will
inform you when new versions become available", but I never saw one
single msg about it. By accident I discovered that a new version had
come out early June. I installed that one yesterday. Thusfar I had an
average block time of around 10.37, max was 12.47 and fastest was
9:17. This morning the block was done in 9:06... OK, the first one for
the new version but I figure it's a lot faster than the old 1.06 I was
running.
I still have problems getting the latest client running under Linux.
Actually it's working, looking at the process-manager (which shows
SETI takes 99% of CPU time), but I only installed, didn't fetch a
datablock and there's no way of checking WHAT it's doing. Got the
glibc 2.1 client here, also version 2.4.

This is generally a bad idea.

What I recommend:

C: 5mb boot partition only
D: 512mb GEM applications that expect old TOS filesystem

E: and following, whichever size you want, but don't use BigDOS.

Instead, use either MagiC or MiNT, both of which have built-in
support for large partitions and are generally safer than BigDOS.

Have a look at the NetBSD/Atari port's FAQ.

http://www.netbsd.org/Ports/atari/faq.html#term

The general idea is this:

^^--internal---------^^--||-------external--^^

^^ = terminators
|| = DB-25 external SCSI connector

The SCSI chain is a straight line, and there must be resistors
at both ends. One end is always the internal drive, and must be
terminated at all times. This is the simple part.

The complicated part is, either:

1) The other end is not used, in which case you should insert
the resistor packs inside the TT, at the location marked on
that NetBSD/Atari FAQ.

2) The other end _is_ used i.e. there are devices connected on
the external SCSI connector, in which case you remove the
internal resistors and instead terminate the last external
device of the chain.

In both cases, the TT's internal drive is always terminated.

What changes is, the other end is terminated either near the
DB-25 SCSI connector inside the TT, or at the last external
device of the SCSI chain.

I personally have not used the Spectre GCR on my Falcon but I have seen
people run it on the Falcon just fine.

The Atari 2600 computer I have IS NOT a plug in unit. It is a fully stand
alone Atari 2600 computer system. It's roughly the size of an Atari 600XL
computer. I have JPG's available of it for any interested people. Just
E-mail me and I'll send them out to you.

For Sale: Atari 520ST upgraded with extra .5 mg (equivalent to a 1040ST) with manual, an Atari SM124 monochrome monitor with manual, a mouse, and a C-Lab Creator (music sequencing software same as Notator without the notation capability) dongle with disks and manual. Accepting best offer on each, want to sell ASAP. I'm in New York City.

OK, did the article timeout, or continue along without stalling? I
assume because of the title that a header with subject <no subject>
did appear.

Was this online or offline news reading? It makes a difference, since
the processing paths are different.

Hello Raymond,

RC>Could you tell the folks in the group these tricks?

there is no trick. The only thing I did was a total reconfiguration of HSMODA07 with the setter.ttp of the HSMODA07 package. Other versions of the setter could have damaged the processed hsmoda07 files.

This is the relevant part of Ronald Andersson's mail:

...
The new STinG kernel and dialer use serial.stx the same way, so thatshould not be a problem. The big question is _why_ the newer serial.stxmodule doesn't work for you.Checking back on the feedback I got when it was first released, I notethat most complaints came from people who eventually fixed it by makinga new installation and configuration of the HSMODA07 package.The new speed improvements of serial.stx depend on known functions anddata structures of HSMODA07, so it is important that this is installedand configured properly.In one case the problem was that the setter.ttp from an older HSModemrelease had been used to configure the components of HSMODA07. Whenthe guy reinstalled the components again and reconfigured them withthe proper setter.ttp, then all his problems disappeared.Somehow the old setter.ttp had caused an error in the HSModem driver(s?)which caused the new serial.stx to fail, but didn't affect the old one.I'm not at all sure if the same applies to your system, but it shouldbe worth checking anyway.While you are doing that you may also want to set some more reasonableHSModem buffer sizes than the 256 byte defaults. I recommend using16Kbyte for reception buffers and 4KByte for transmission buffers.(I use these sizes myself, for all HSModem drivers.)Those sizes are a lot larger than normally needed, but they eliminatesome 'time costs' in the interface routines, and also minimize therisk of data loss during 'abnormal' application routines....

In theory... I have two internal drives in my TT, no external. The
motherboard is terminated, but if I terminate the last drive, it just
won't work. The TT won't recognise any drives at all, regardless of which
driver I use. When I don't terminate the last internal drive, everything
works perfectly.

So my advice is to start by terminating "by the book", and then start
experimenting if it doesn't work. (Btw. doing it by the book can actually
be harmful with some hardware, like the Mega STE or STacy...)

The Tina Turner Demo is on the Moving Pixels CDROM.
You can get that for $9.95 at myatari.com . There are lots of
great demos on the CDROM. Other CDROMS & Atari stuff also
available. File is 70 Mega Byte self running. Not std file
format. It has been my experience that it only runs on the
Falcon internal IDE HD and then only certain ones. I upgraded
to a larger, faster, internal and ended up with skipping on
Tina Turner but everything else worked fine?. Maybe buffer
compatibility, interleave, they lied(not faster)? I have never
got it to work on an external SCSI. Bruce

Hi Derryck,

I have just checked this on my Hades in 3 different resolutions and there
is no problem with the style change dialog. The printer dialog shows
<remove report> but the final "t" of report is slightly cut off - still
readable however. The shortcut shows the "v" of remove underlined.

There were several similar problems during the beta-testing time and ROM
corrected most of them. Perhaps you could e-mail Ulli with details of
your problems as there may be a difference in our systems which is making
them show up on yours and not mine.

BTW, which version are you using ? The latest up-date I've got is 8.21A.

Cheers

Paul

There is no such thing as pure CPU performance. A CPU can't do anything
by itself. The memory system is always involved.

>seem to be clouded with interference of the systems that those CPUs were fitted in. Off

Yes, but only the memory system and to some degree disk (should be minor
since SPECmarks is a workstation benchmark and the data sets should fit
in memory on reasonable machines).

>course, each benchmark only shows us CPU speed on the given code...

If you look at the official SPEC pages, you'll find complete machine
identifications.

>One might argue that this is actually real speed as one depends on the whole system and
>not only CPU.

That's the point.
SPECmarks are used by people who buy computers to do work rather than
play games or run WinBench.

>Still, arguments were made regarding CPU speed, not system speed.
>(As "68060/66 is comparable to Pentium I/90" etc).

You always have to assume _something_ about the surrounding hardware.

>> >> >CPU/MHz Int Float
>> >> >68000/16 0.14 0.16

>> >16MHz ?
>>
>> Does seem a bit low, but we don't know anything about the rest of the hardware
>> for these machines. I would have guessed at a factor of 4-5 or so.

I realized another thing last night:
These benchmark numbers are likely to be from some kind of workstation
(Sun and others made them using the chips above), which means that
memory systems and cache can be quite a bit better than you'd find in
a normal Atari machine.

More importantly, perhaps, it's not at all unlikely that the FPU was
something completely different from the 68881/2 (note the -mfpa for
Sun's floating point accelerator among the 68k options for gcc).

>That's what I was talking about. 030 system seems to be poorly/economically designed. I

Relatively unlikely for something that SPECmark was run on, but not
at all impossible, of course.

>> Uhm, no. The very best the '030 can do is two cycles, and that's for simple
>> instructions like add, etc. For the same (as long as they are only 16 bit), the
>> 68000 usually takes 4 cycles. Anything involving memory takes more.

>instruction... Everything else takes more, up to DIVS, which can take some 140 cycles.

As I said, the '030 is similar in that regard, but there 32 bit doesn't
matter.

>Usually the average is much higher than 4 cpi...

Just as it is much higher than 2 cpi on the '030.

>Even if 68000 had a FPU, one would expect that software handler for FPU communication
>would cause considerable additional slow down.

Yes, but then you would have more or less exactly the same slow down as
for integer code, which the numbers showed.

>> The '030 number is far too high compared to the other machines otherwise.
>
> I guess it depends on what's in a test. 030 is the fastest combination with
>full-instruction set FPU. Everything newer (040 and up) has simplified FPU that needs CPU
>assistance to execute complex instructions...

Even '040 should be able to emulate the missing instructions at least
as fast as an '882 can execute them (according to Motorola), but in any
case, most numerical computations only use the simple ones.

>Thanks for the URL. I'll take a peek at the source code when time permits...

If you're talking about the SPECmarks source, those are probably several
hundred megabytes. I think all the programs are available as source code,
though, so you should be able to take a look at them (the various
applications included should be mentioned at www.spec.org).

>> >> >68040/40 1.16 1.31
...
>As said, FPU unit in 040 is different than 68881/68882. It does lack many instructions,
>which have to be emulated. OTOH, new FPU unit is on the die, on the other side of the
>internal cache and FPU transfers shouldn't bother CPU nearly as much as with 030/68882.
>One would expect to get FPU speedup totally different than CPU speedup.

I would have expected a larger difference as well on the FPU side, but
the '030 in question may not have been using an 68881/2.

>>
>
>Wasn't 603e cheap version without FPU?

No, but it only had one FP unit, while at least the 604 had several.
It's been a while, but I also seem to remember double precision taking
longer, but I may be wrong about that.

>I'm not sure about this, I'll have to check, but I know that 603e was degraded in some
>way, compared to 603...

No, it was improved (2.6 million transistors compared to 1.6 million
(mainly more cache, IIRC)).
I believe even the 601 was a more complex chip (2.8 million transistors),
but they never made those at as high clock frequencies.

>On the secon thought, maybe I should send a buck or two to those Spec guys.
>Their results on the 68000 make me feel young :-)

I doubt they've run any tests themselves.

Uhm, I did mentioned those parts, for obvious reasons.
By 'the rest of the hardware' I was referring to disk, display, etc.

If you include the memory system, naturally.

>not a whole computer. How have they achieved this?

By not doing any graphics or major disk access (some disk access is
of course need, for example to compile gcc).

>A lot of people seem to think that a computer that
>has the fastest Mhz is the fastest machine - they're just

No disagreement there.

>I can accpet that a 060 @ 66Mhz has similar grunt to a P90. P90
>machines probably have their memory at 33mhz don't they, whereas
>the Milan II will have it storming along at 66/80 mhz.

No, the Pentium generation has always used 50/60/66/75/etc MHz busses
(depending on the specific chip and motherboard settings).

Also, unlike the '060, the Pentium uses a 64 bit wide bus.
Twice that of the '060!
(That's why some clueless people (including magazines) used to call
the Pentium a 64 bit processor.)

>Doubling the STs CPU gives a measly 120% speed increase overall,
>whereas doubling the clock can give far more.

Yes, but for a CPU with internal caches it's not nearly as bad as that.

>They also have to take the OS into account, I know which one's more
>efficient out of Windows and Magic..

I don't even think you _can_ run SPECmarks under Windows.
There are lots of other OSes out there for PCs, you know.

Sure, Windows takes more power than GEM, but with modern processors
and graphics cards, that's no big deal.

>I would say bus/memory speed is a lot more important than CPU speed.

See above.

>Leave that "1Ghz" crap to the sales people at PC World.

Those 1 GHz chips have several hundred kbyte internal caches, running
at processor speed. Compare that to the 16 (or was it 16*2?) kbyte of
the '060.

>>>
>>>re. the above topic. It's in french but I think it shows that against a
>>>top end PC running MagicPC, GEMBENCH figures show the Milan 2 to be very
>>>very much slower.

No, the GEMBench figures don't really show that.
In fact, GEMBench figures don't generally show much at all. ;-)

I have another article ready for posting, discussing those numbers
and comparing them to my AB040/Eclipse, but I'm not going to post that
until I can get some confirmation as to whether those benchmarks really
are versus a Falcon _with_ NVDI. That's not how those comparison numbers
are usually reported (since GEMBench doesn't have any NVDI numbers in
its default comparison set), and going by other Milan GEMBench numbers
on the net, I really doubt it's true.

If someone could send me some GEMBench numbers from a normal Milan,
running NVDI, so that I can check this, I'd be much obliged.
(Please, send the entire generated file, including the timings, so that
there is no question about the numbers.)

>I really do not care if the Milan 2 is slow then some of the upper end PCs.

Note that a 600 MHz Athlon is by no means an upper end machine.
The slowest (MHz wise) processor I can even find at the usual places here
is a 500 MHz K6-2.

The AMD Duron (the budget variant of the new generation of the Athlon
processors, generally accepted to be at least as fast, clock for clock,
as the old Athlon) 600 can be had for about $100 (one hundred dollars).
Hardly high end!
(Actually, I'm going to upgrade to just that processor within a week or
two (just waiting for the mainboards to arrive).)
The old Athlon 600 will set you back $200 or so (the new one has the
level two cache on chip and is thus much cheaper to produce).

>That will not enter in my decision if I decided to get one. SUPPORT is the
>big issue and lots of hardware is another. It is fast enough for most

Then I would have thought you would have bought a PC. ;-)
The support (if you buy from the right place) is hard to beat, and
the amount of hardware is completely unbeatable.

William just go under "Text" and then under colors. That is where I mean. I can load a picture and display it in color just fine. It is just the text that are the problem. I loaded a demo on a TT using a Crazy Dots Card and it did the same thing. I am wondering if anyone has gotten the user defined colors to appear.

CPU performance represents to me the level of performance that particular CPU would reach unhindered by the rest of the system. Whether or not this is realistical for given CPU is another matter.
For all systems that would be access to external memory without wait states.

<SNIP>

>

Yes, but that something might be almost invisible to the CPU, like ordinary ST, where CPU almost never waits for memory or it can be something like TT, made originaly with 16MHz 030 in
mind and fitted with 32MHz adapter in the last moment. All this without L2 cache, off course.

One thought though. These spec tests are made in order to favor high power machines- like
Intel. If anyone can pick the tests, I want to pick the place.
And since STM have made nice low cost radiation hardened 040's in 0.35um for space
programs, I
wote for continuous 6-month benchmarking in the high radiation zone orbit ! Like old saying
goes: Surwivers shall speak ! :-)
Long live 040 !

An ATARI (all machines) convention in Germany.
The convention is in east Germany, in Lengenfeld.
There is a map at the party site (http://unconventional.atari.org).
The date is the 1-3. September 2000

That's is what I thought.
The best way to see what we mean is by loading the pap_help.pap.
That doc contains lots of colored frames. All these colored frames are
using User define colors. All what I see is a rastered frame, no colors
whatsoever. Once exported to html the colors (pale green) are there
alright.

>I wonder if it is O.K. with the new card ?

I guess you refer too the Rage Pro card. As the graphic card driver for
the Rage Pro is NVDI (special version) I suppose it will work too.

Gadgets by Small was holding it pretty tightly to their chest. I begged
for it, even a beta version because of the support for the TT internal
SCSI drive, but they refused, explaining that it was their last chance
for financial recovery, but that plan never materialized, and so even
those willing to pay never got it. I never heard of any beta testers
leaking it out.

Oh, it's possible. I ran it straight off the CD (8x). It was a
bit choppy, though.

| In theory... I have two internal drives in my TT, no external. The
| motherboard is terminated, but if I terminate the last drive, it just
| won't work. The TT won't recognise any drives at all, regardless of which
| driver I use. When I don't terminate the last internal drive, everything
| works perfectly.

A nonpowered second terminator may do more harm than a missing second
terminator. Something you may want to check.

I assume you mean the Epson Stylus COLOR 600 (I don't think they made a monochrome 600, although they did make a monochrome 800).

From the Epson support webpage:

"For color output choose the Stylus PRO, Stylus COLOR 500, Stylus COLOR II, LQ-2550, or LQ-860. For monochrome (black/white) printing select one of the following LQ or SQ models: LQ-870/1170, LQ-500, LQ-570+/1070+, SQ-870/1070, or LQ-850."
[Source: http://files.support.epson.com/pdf/sc600_/sc600_f1.txt]

There may also be some third party drivers about. ELF software made a HP660C driver that does a good job of color lineart on my HP612CL (it's not so good on photos, though).

>whatsoever.

Hi Martin/Edward

I have just been looking at the Help file. If I call it from the Help menu, then the colours are fine. If I load it as a PAP document, then some of it appears differently. Is this what you are talking about ?

For example - if I go the the end of the file (Chapter 28) and look at the "Startup Parameters" I see the table with the columns headed "Parameter" and "Explanation". In the PAP document these words are in a frame on a white background. In the Help file (called from Help menu) they appear on a green background.

I did some experimenting with the object properties last night and the user defined colours worked fine on things like text frame lines etc.

I have just tried changing the fill and text colours in the Help.pap document and this works as it should.

Maybe the Help.pap document is not meant to display those colours when called as a document ?

Cheers

Paul

Hi Jo,

JES>When I don't terminate the last internal drive, everything works
JES>perfectly.
an incorrectly terminated SCSI bus /may/ work, if it's really short
(cable length!) but you can't rely on that.

If your host adapter is _not_ between the tow drives, I mean
drive1<->host<->drive2, you have to terminate the host and the last
drive.

If it's like described above, you must terminate both the drives and
'unterminate' the host...

Aha... a Draconis User... fascinating.. I have been pondering that lately.
Of course I saw Cab 2.7 with NVDI... wow... that's not bad!

Well, what you said above takes a bit of maturity to say, and it is the
realization that perhaps it's good to have something good that you enjoy. As
long as you enjoy it and you have people to enjoy it with, that's all that
really matters.

The world can march on. I know a good thing when I see it.

Actually that was the Atari 400/800 .. but the ST makes a nice accessory
to that. ;)

> Edward S. Baiz Jr.
> (Gamer)

Hmmm.. sounds like the last Atari club I was a part of before JYBOLAC. :)

One thing to have to understand is that there are two users in the Atari realm. The power user and the hobbyist. I am a hobbyist, a rebel without a clue, a person who likes it simply because it is Atari.

The other user pushes the Atari to it's limits. We have them to thank for many innovations in the Atari realm. They push one boundary, maybe two, and then they meet the end to whatever innovation they made, decide there is more power elsewhere, and move on.
After they move on, having exhausted all they know to do on the system, they tend to question why anyone else would care.

At any rate, there you have it. Don't dispair, there are still those who will talk to you.

Currently experimenting with ways of getting a Newton MessagePad to connect
and transfer data and files between the Newton and 400/800 / ST. Going quite
well. See if the Palm has applications good for taking care of itself, like
sending notes through the serial port, or a terminal program that has various
downloading protocals.

>Perhaps because the correct termination sometimes does not work? Try to
>"correctly" terminate a MSTE/STacy SCSI-adapter, or come over to my place
>and correctly terminate the internal SCSI-chain in my TT...

I want to support Uwe strongly on this. My experience with both MSTe and TT has been that, if you terminate by the book, things will work. If you do not, they may work with with no or one external drive connected, but with two external drives and a cd-rom failure is almost certain.

The host electronics of the TT are at a T-intersection. One arm at the T goes to the internal drive. The other arm goes to the SCSI port. Both arms should be terminated at their ends. That is, the internal drive should be terminated. If no external drive is connected to the SCSI port, then the SCSI port termination resistors, on the mother board of the TT, should be in place. The fact that the internal drive will probably work if they are not in place does not falsify this statement.

When external drive(s) are connected to the SCSI port, the port resistors inside the TT should be removed and the last drive in the external chain terminated. The internal drive should remain terminated.

The host in the MSTe is not at a T - it is merely at one end of the chain. Normally the internal drive should be terminated. However if, as is recommended with the Link96 host adaptor, the SCSI chain is extended past the internal drive to an external SCSI port, then the internal drive should have its termination removed as soon as something is plugged into that port. Ideally it should have its termination removed at all times and a terminator plugged into the port when nothing else is connected, particularly if the new cable from the internal drive to the new port is at all lengthy.

If the TT or MSTe is transferred to a new case, the distinction between internal and external drives becomes somewhat academic, but the rule remains the same. If the host adaptor is at one end of the chain (the usual MSTe case), only the other end of the chain should be terminated. If the host adaptor is somewhere inside the chain (the

usual TT case), both ends should be terminated.

Terminators have never been used on an ASCI chain. Things may have been simpler if they had been. Then we should not have had all the warnings about only using one or two devices and keeping the cables very short.

723. CDRW questions

Newsgroup: comp.sys.atari.st
Date: 2000-07-20 00:00:00 UTC
From: claytone@aa.net
Message-ID: <3977b62c_2@huge.aa.net>
Source record: 59452

Hi all,

I'm ready to take the CDRW plunge, and would like some insights from those of you who have experience. I'm using a Falcon with Nemesis, TOS 4.04, ICD Pro 6.5.5, external 2.1 gig Seagate SCSI, 1 gig internal IDE, external Syjet 1.5 gig SCSI. I want to write music CDs, and be able to use CDs for backing up audio files, and other software.

Hardware:

What brands/ models work well, and those that have problems with Atari. Yamaha and HP seem to be commonly available. I've also looked at some of the "stand-alone" CD recorders such as by Tascam.

What speeds (write/rewrite/read) are good? what speeds are "overkill"?

Software:

Which CD recording software do people recommend? What is good or lacking in programs? I know that Soundpool and Anodyne have programs - any others I should consider?

Would any of these hardware/software combinations allow me to simply hook up an analog source to the CD recorder and record straight into it without needing to make a hard-drive file in the computer, convert it to the appropriate audio format, etc.?

Media:

There are a lot of blank CD brands - Imation, Memorex, Sony, DigitalMedia, PNY, Traxdata... to name a few. I've seen catagories of CDR, CDRW, Audio CDR, and even AudioCDRW. I know the difference between CDR and CDRW being that the CDRW can be RE-written and the CDR can NOT. What's the difference between CDR and Audio CDR? Also between CDRW and AUDIO CDRW?

Hope I'm not exceeding the maximum number of questions per newsgroup posting. Am I? How many are allowed? Why? Should I just shut up now?

Thanks for any insights,

Clayton Murray
Seattle, WA USA

John, if you only knew.
Rodolphe, (hi rodolphe since you read here) is an opportunist with some electronics skills. Falcon users are so desperate for a person that can handle their beloved machines that they would put their trust into anyone. Now, the sadest part is not that he is trying to get a few extra bucks on atari users back, but it's that someone shitting on their face, they would still ignore the fact just because there is nothing else better so they just eat it or beat it.

Well, I know that Rodolphe hates me, and probably half of this newsgroup too, but honestly it does not really matter as I know exactly where I stand for.
Rodolphe, I know you're probably going to try once again to threaten me to court for opening my mouth in public. Just know that I am ready for any action you might take.

Now, I don't deny that Mr. Czuba has some customers that are actually happy, and I am really glad for them and somewhat shows that mr. czuba is not THAT bad.
However, know that half of these "Satisfied" customers just shut up because of his bad attitude.

Please, real happy customers, speak up, and show your enthousiasm for centek/czuba, so other potential customers can see that I am wrong, and all would be fair. But at least, I would have spoken for the few too shy to say a word.

Mr. Czuba for the last time (at least 6th now), stop sending me spam in my personal mailbox, If I want news as I told you before, I would go in the newsgroup more often, OR would check your personal www page.

Thank you.

atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to bensmith@teleport.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

any SVGA monitor can be hooked up by doing the following, ground mono detect on the 13 pin plug, connect rgb on the vga socket to mono out on the 13 pin plug, and al the rest are the same. i.e. h sync to hsync, v sync to v sync and grnd to grnd..

Alright, I'm tired of waiting.

My credit card was charged months ago for N.AES 2.0, and I still haven't received it. As far as I'm concerned, if I payed for it, I'm entitled to a copy.

Would someone out there be kind enough to send me image(s) of the floppy disk(s)? English version preferred, of course.

Thanks in advance,

Michael White (michael@fastlane.net)

Hello folks!

I am looking for this Star Trek-type strategy/hec game. It was
available for the ST (and the Atari 8-bit). I would love to have it
complete in the box, but an original disk would suffice as I have a copy
of the 8-bit version.

Thanks
-Marlin

I know it's easy to do on a PC, but I'm not sure about a mac - it's definately not impossible. This may sound silly, but are you using standard double density formatted disks to do this? Seeing as the ST only has a double density drive.

If it's works you're lucky. Nevertheless it is wrong.
I wonder why some people try to give wrong advice to others. The
specification clearly says how to correctly terminate. Anything else is
wrong, even when it works by chance with some systems.

> It appears as though you intend the CT60 to be a "computer on a card"
> that simply uses the Falcon for input/output. Is this the case?

YES, and it is exactly the same thing for the CT2 !
CT2 is too a computer that use Falcon as I/O !

> The
> main reason I didn't buy the CT2 was because I simply could not risk
> having the Falcon become non-stable (a fate that for some reason did
> occur to some CT2 owners).

Do you really think that a serious company can take the risk selling a
product that is not sure ????!!!!
You were wrong to not buy CT2 because it is a very stable product !
Sure, some times, to become a stable product, some people should explain me
their problems !!!
What they surely not did !! And that's a shame because, after, some guys
like you think that CT2 is not stable !!!
But CT2 is perfectly stable each time the guys had let me to solve their
problems !!!
Sure I can't imagine that a guy has problems if he don't tell it me !!!!
When people buy a car and have problems they go immediatly to request the
problem to be solved !
Why not on atari world ?????!

I'm really bored by the stupid attitude of certain atari users that consider
that it is normal to be fucked by a reseller/producer with a not good
product !!!
Hey, I'm not like some bad companies on atari market ..... I'm honnest !!

Let me know if you want to be in the CT60 list or not ...

> drive.

> If it's like described above, you must terminate both the drives and

I have host<->drive1<->drive2. The only way to get it to work with my two drives is to terminate the host, and not terminate drive2 (and drive1 ofcourse). If I terminate the last drive (regardless of which drive I connect at the end) no drives are recognised. I have tried every possible combination of drives and termination, but my current setup is 100% stable.

Perhaps because the correct termination sometimes does not work? Try to
"correctly" terminate a MSTE/STacy SCSI-adapter, or come over to my place
and correctly terminate the internal SCSI-chain in my TT...

My Falcon shows the "User Colors" as various grey rasters, and the page from the Help doc you mention shows a similar fill whether it's loaded from the Help key or as a PAP doc.

Seems to be a bug then?

So, from this explanation, I gather that TWAIN and GDPS are functionally
similar, but still different. Therefore, if a camera uses TWAIN protocol
to communicate (via RS-232 link) with a computer, it CAN NOT be used
with some GDPS-compliant software on the Atari, can it?

That's exactly my experience. Except some misunderstanding (maybe
caused by my german English and Rodolphes french English) Rodolphe
always tried to help and so I'm quite satisfied, and being as happy
as I am with my CT2 is the main reason that I'm not yet on the CT60
list (I can't even remember the last time I had to put my Falcon
back into slow mode).

You're not the only one... Contact your credit card company, you should
get a refund from them.

I am not sure it is a bug or what. It is hard to believe that this feature
is only good when using the ET4000 graphics card. It does not work on a
Crazy Dots card or the Nova Mach 64 card. Maybe ROM can adjust the calls
that Papyrus makes to try to adjust this.

Who did you order it from. Woller Systeme? If so, I had the same problem with N.AES 1.2. Woller said he never received my cashier's check and I had to scan/email him the cancelled check. Finally he sent it to me. Could have been an over-sight, but who really knows....

I downloaded the demo of HDDiver version 7.91. I found I had to turn off the instruction cache in order to boo the auto-folder program. Then I installed the demo SYS file on my partition C. When I rebooted, it went smoothly. I was pleasantly surpised when I found out I could use the utility file without having to turn off the instruction cache on the Hades acc. I was thrilled that I also could re-install the SYS file with no problems. I guess I will be upgrading.

I was, however, sadden to see a statement on Uwe's site that the Hades is no longer officially supported. I guess the cache problem was too much.

Pretty sure the Direct TT 030 was a TT with a (48Mhz) CaTTamaran fitted.
The 060 was a Direct cased Medusa.

The MSTE adapter is no SCSI adapter, but an adapter which allows to connect
a single SCSI drive (it fails in several parts of the spec), so the spec
does not apply to that one anyway.

On what applications?

Try running Linux and CPU-intensive applications on both (like a gcc
compile on a large source file, or tex with the source files icached in
memory). You will notice that a P120 easily beats the 68030.

You don't have to like them, but Intel CPUs do have a good performance per money ratio if you do not need the current high-end ones.

DirecTT 030 was an Atari motherboard, tower-mounted.

DirecTT 040/060 were Hades motherboards, tower-mounted locally
by Chris, instead of in Switzerland by Medusa Systems.

Trevor,
I Don't see this post I uploaded 7/18 or 7/20 so here goes again!
Sorry if it eventually shows up 3 times!

It does'nt matter where I'm on the list as long as others show there interest! Regarding Javascript in John R's browser, I assume a lot more has to be done with the browser before the possibility of Javascript being incorporated (as a very uneducated guess!). But stability and bug removal should come first and John shows his interest by actively engaging in the newsgroup. Really nice to see!
John G.

Loaded from the Help menu or loaded as PAP doc makes no different. The
colored columns are in both case in monochrome.

>
>Maybe the Help.pap document is not meant to display those colours when
>called as a document ?

For me it sounds more like a bug. Not from the graphic card driver but from
Papyrus itself.

All fine but can you use your external SCSI devices without having to turn
off the instruction cache?

On my Hades HDdriver v7.90 just won't let me access the external
SCSI-devices.
Sure if I switch off the instruction cache I can use them but as you know
turning off the instruction cache turns the Hades into a slow machine.
Even with hades_b5.acc it is impossible.
The last version of HDdriver that works for me is V7.6

Hello,

I send this message on behalf of Karl Samyn. Currently he doesn't have an
Internet connection. If you've a reaction you want to mail via PM please send
it to me. I'll forward the message to him.

CU
Martin

------------Forwarded message-----------

Subject : Falcon + Ethernet : SUCCESS

Finally, I succeeded to connect my F030 to an ethernet network
and do some succesfull tests. Already a couple of months ago I
succeeded to "ping" between a PC (Win NT) and a F030, in both
ways. Since that day I didn't do any more tested, but yesterday
I started again with testing.
This was the setup :
1 PC with NE2000 PCI network card + Windows 95 TCP-IP stack
1 Atari F030 with parallel pocket adaptor + Sting 1.20 + RTL8012 driver
1 Atari Mega ST4 with Riebl card + Sting 1.20 + Riebl driver

I succeeded to ping between all computers. In a next test I
installed a HTTPD on the PC and was able to connect to it and
get pages on the F030 using CAB (using the URL of the HTTPD).

How is the F030 connected to the ethernet :
- harware: parallel pocket ethernet adaptor with RTL8012 ethernet controller
ROM port device to connect adaptor to the ROM-port of the F030
- Software: Sting 1.20
RTL8012 ethernet driver for Sting

Let me make clear that all thanks goes to *Vassilis Papathanaiou*
for his ethernet driver and the PCB layout of the ROM port device
and also to *Elmar Hilgart* for fabrication of a working ROM
port device (mine refused to work).
Tests with BNET were also conducted, but were not succesfull
so far. I'll have to look again to the host.inf file and
route.tab to be sure no problems is there.
No tests of sharing files and directories between an Atari
and the PC were conducted since there exists (IMHO) no NFS or
NetBEUI program/protocol available for the Atarin (i.e. for a
decent price or share-ware).
Since I have no internet access at this moment I'm not able to
update my pages. But from the moment I can I will do so.

Screenshots and a complete "How-To" guide will be available.
If you would have any questions, address them to Martin. If
that's OK for you Martin... He knows how to contact me.

Greetings,

Saka

True enough. Personally, I think it's a pity that TOS 4 wasn't
ported over to run on the Intel line of processors.

Ataris are my hobby. Motorola is simply a chip maker.

>> could not risk having the Falcon become non-stable (a fate
>> that for some reason did occur to some CT2 owners).
>
>Do you really think that a serious company can take the risk
>selling a product that is not sure ????!!!!

In the Atari world there are certainly companies that sell non-stable products. I have no idea if they were serious.

>You were wrong to not buy CT2 because it is a very stable
>product ! Sure, some times, to become a stable product, some
>people should explain me their problems !!! What they surely
>not did !! And that's a shame because, after, some guys like
>you think that CT2 is not stable !!! But CT2 is perfectly
>stable each time the guys had let me to solve their problems !!!

I well recall people getting frustrated over the CT2. I also see many happy CT2 owners. The conclusion I drew from this (correct or not) was that most CT2 owners were happy, but that there was a risk. I still use my Falcon every day for grading, budgeting, and general computer use, and I felt that I was not willing to take that risk.

>Let me know if you want to be in the CT60 list or not ...

Well, what do you think, guys? Was my concern unwarranted, or do you think my caution had merit? FWIW, I intend to buy a Milan II (if/when it comes out), but I could afford to get a CT60 for the Falcon as well, particularly since it apparently will be within my rather modest ability to install.

Hi Derryck

>My Falcon shows the "User Colors" as various grey rasters,

Eek!, ive been checking out the demo ive got, (single parent pauper drooling here), and thats what i find as well, MV300 Graphics card in 256 colours here, also i find the text in some of the Interface is poxed as well, so are these problems in the production version as well.

<later>

Ive just transfered this demo to My PC and run it under MagicPC/Jinnee and the colour buttons are OK

Where's Ulli, he's gone quiet lately?.

Yep, but it's $600.
http://www.softhut.com/cgi-bin/test/Web_store/web_store.cgi?
page=catalog/hardware/monitors/ycplus_19inch.html&cart_id=6949490
_26183

>Or is there any sort of trick or magic that can be done to
>raise the frequency or make it work somehow?

This is easier and cheaper (<$150), and it is called a scan
doubler. There are several available, one of which is at
http://www.softhut.com/cgi-bin/test/Web_store/web_store.cgi?
page=catalog/hardware/accelerators/apollo_scandoublers.html&cart_
id=6949490_26183

Caveat: Although there is no reason why these should not work,
I have not personally tried it, and an adapter cable may have to
be made.

Short answer: Yes.
See http://gem.win.co.nz/mario/hardware/stvga.html.

Long answer: Yes, but you'll have to modify the signal strength (the STE is a bit above VGA specification) and you'll have to make (or buy) a cable that maps all the color lines to the STEs monochrome line. Fortunately, ST High is close enough to monochrome VGA that the modern monitors don't seem to mind it.

I know a few ct2 owners who are not 100% happy and have had
the machine sent to you know who, and yet all the problems
were not solved. Maybe the magority are completely happy,
however I also won't take the risk either. Asking questions
can't hurt anything, especially if it's going to cost you
money or possible heart ache.

No need to travel here, but I would like to say I was not stating
how the SCSI spec _is_. I was stating how my setup worked, which
to me is 2 very different things. It was something for him to
try, that is all. And as much problems as he had listed, trying
something just a little out of the norm didn't seem harmful.
My setup has been this way for several years, I cannot
explain why it works, only that it does.

I've used Yamaha, Plextor and Teac with no problems. I use both
Anodyne's CDWriter suite as well as SoundPool CDRecorder Pro 2.

>I've also looked
>at some of the "stand-alone" CD recorders such as by Tascam.

Forget it, no SCSI interface.

>What speeds (write/rewrite/read) are good? what speeds are "overkill"?

Define overkill. The Falcon's SCSI port imposes a practical limit
of 6x, and then you need a fast source drive, preferably EIDE HDD.

>Software:
>
>Which CD recording software do people recommend? What is good or
>lacking in programs? I know that Soundpool and Anodyne have programs -
>any others I should consider?

SoundPool's is more professionally-oriented, hence the provision
for lots of sub-formats like mixed mode and Red Book audio mastering
with PQ encoding. You can now buy SoundPool's software as audio or
data only, previously the two components were only available together.
Very good software each time they've ironed out the bugs with new
recorders. In my experience it also records perfectly reliably straight
from (a sometimes fragmented) hard disk without making an image file
first. A real time-saver.

Anodyne's Software is very user friendly and has great support
from its authors, too. I've found it to work straight away with
every single CD writer I've managed to get my hands on.
Anodyne's suite allows Atari-readable-only hard disk partition
back-up (with ReWrite support), audio CD (though not Red Book,

so you can't take these to a duplication house), and ISO9660
with the latest update. This enables the creation of truly
universally readable data discs.

>Would any of these hardware/software combinations allow me to simply
>hook up an analog source to the CD recorder and record straight into
>it without needing to make a hard-drive file in the computer, convert
>it to the appropriate audio format, etc.?

No computer CD-R(W) drives have A/D convertors, and they would be
lousy quality anyway. Get a high quality A/D:D/A unit for your
Falcon to do the recording. Line Audio Sweden makes the best
available. http://www.lineaudio.se for details.

The whole point of making an image file on the hard disk is to ensure
constant data flow and avoid buffer under-run (although the latest
Plextor drives have BURN-Proof technology which simply stops the
recording when the buffer is empty, fills it up again and starts
recording again from where it left off - nifty). If you want to
bypass having to make an image file, get the SoundPool software.

>can NOT. What's the difference between CDR and Audio CDR?

Audio CD-R media are the same stuff as computer CD-R media, but the
manufacturers would like you to believe otherwise. The difference
is that the audio discs have a key-code pre-written to the disc,
which unlocks an electronic security system on the standalone
audio recorders. Basically, the "audio" discs include a levy,
hence their higher price. Another reason to avoid the stand-alone
recorders.

>Hope I'm not exceeding the maximum number of questions per newsgroup
>posting. Am I? How many are allowed?

If you strategically phrase some things as ignorant statements
rather than questions, then you can get more answers, in the form
of corrections, than questions asked.

How could it ? nVDI replaces old Visual Display Iinterface routines in TOS
with new ones, which are debugged,
enhanced and optimized for speed. Since old VDI does not have routine for
jpeg handling, how can one
expect from nVDI to make things better ?
So, nVDI accelerates screen handling routines, like block copying, scrolling,
textual output, GEM window drawing etc...
IIRC nVDI was always VERY nice thing to have, but I have stopped actively
using my ST a little bit before v4.0,
so I can't judge about 5.0

Don't ask me. Consumers expect things to be cheap, therefore they
have to educate themselves, and yet they don't. Even when there is
good advice available, they don't take it, and make irrational
assumptions, then complain when the product doesn't do what they
think it's meant to. That's asking for it.

If you go to buy a car, the sales person isn't going to question
whether you know how to drive, and if you go there requesting a
particular model without asking any questions, it will be assumed
that you have done your research and made your choice. No good
then to go complaining to the dealer that the car didn't float
when you drove it into a river!

JES>Or if you're lucky, get a cheap, second-hand Afterburner. It has a
JES>much faster CPU and doesn't push the Falcon beyond it's limits. It
JES>will also work with graphics-card.

That's really nonsense. A Centurbo II is much more compatible than an
Afterburner. It just has to work once. Then there are no more SCSI problems
e.g. And there is no fooling around with cache on/ cache off etc. and patches
everywhere. Not to speak that an Afterburner really "burns" ;-)

Did the people you know have the card installed by Rodolphe?

And for me, but that's personal opinion, I trust R.C. more than most of the
AXRO/Milan people.

Greez,

Henrik

I've had my CT2 for about 6 months. It has worked fine, though I've been weeding out programs that don't like to run at high speed. People seem to be afraid of pushing the system clock to 50MHz, but the Nemesis does the same. Double clocking the CPU seems to be a more common problem, as the 16MHz 030 does not like to run at 40MHz or higher. When I ran the CPU at 40MHz on the FX board, I had no problems there either, but no longer have this unit, so I have no idea what the long term survivability is. The FX developer swears by its safety and says his original Falcon still runs fine with the FX installed. Rodolphe bypasses this issue by placing a 50MHz 030 on the CT2 card.

This is pretty old news, and I believe it was pretty well covered in the Atari magazines of the period, though I can't recall any specific issues to refer you to. The subject comes up once and a while in this newsgroup. You might try posting a question with a specific "Dave Small" subject line. He has occaisionally surfaced here or at ataricentral.com to post a message, but never hangs around to pursue dialogs, and doesn't answer email. For that reason I deleted the bookmark to his web site, which was primarily a family site with family photos, etc.

There is a whole list of Multi Sync monitors that can be used with the Atari ST line. Yes, it does take a special cable that can be bought at Best Electronics or you can attempt it yourself.

I have a NEC Mutli Sync 2 that I beleive will work with the cable and the ST.

I was under the impression that electing to Record a CD would result in the
ISO file being written to the CD if no other options in the dialog box had
been chosen. Could be wrong I guess! :-)

>> Would any of these hardware/software combinations allow me to simply
>> hook up an analog source to the CD recorder and record straight into

>The Soundpool software doesn't allow that but I wouldn't try it
>anyway, at least not with CDRs because you know, one single buffer

Or a coaster? :-)

It's a hardware issue so isn't program related. (Clayton might care to look
at CDLAB as well, http://fgalea.free.fr/cdlab/info.html BTW).

Hallo Katherine!

KE>Please, real happy customers, speak up, and show your enthousiasm for
KE>centek/czuba, so other potential customers can see that I am wrong,
KE>and all would be fair.

Well, I obtained a CT2A second hand and tried to fit it into one of my Falcons
myself. Installation wasn't that hard, but the CT2A wouldn't work properly
either. I was able to use it in turbo mode, but no fast-RAM was recoghnized.
After fiddling around with it for some time, trying different SIMMs and
removing the original CPU with no effect, I sent the mainboard to Rodolphe for
repair. A few weeks later I got it back, and since then it has been working
flawlessly. I don't know what was wrong, the only comment Rodolphe wrote was
"fitting was bad", but I don't know in which respect.
Anyway, this CT2A Falcon with 14+32MB RAM, but without IDE-Drives due to a
broken IDE port (not CT2-related), is working very well now, with absolutely no
stability problems or hardware-related crashes.
Great Job, Rodolpe!

mit freundlichem Gruï¿½ aus Ahornberg
Ekkehard

Hallo Derryck!

DC>I doubt that I'll join the CT60 list though, unless I had a second,
DC>unmodified Falcon into which to plug it in! :-)

Well, I've got such a Falcon sitting around here, but I've also got a Milan I and a CT2A Falcon. Since video display with a decent graphics card is better than with a CT2 Falcon and it's (to a certain extent) limited hardware, I'd rather a Milan II than a CT60. If I needed one, that is, as I normally don't need more than two computers.

mit freundlichem Gruï¿½ aus Ahornberg
Ekkehard

(I _do_ need two, though, because I drive home on the weekends and don't want to carry those large tower cases forth and back every time :-)

No! *Don't* terminate internal drives on the MSTE or STacy, it can kill
your SCSI-adapter!

As for the TT - well, with my current drives (one 540Mb Conner and one 3Gb
WD), it will simply not work if the last drive is terminated. And I have
tried to replace the SCSI-cable.

> If you do not, they may work with with no or one external drive
> connected, but with two external drives and a cd-rom failure is
> almost certain.

I have my TT in a tower, and only use the internal SCSI-chain, so I can't
comment on this.

> board of the TT, should be in place. The fact that the internal drive
> will probably work if they are not in place does not falsify this

But what if the internal drives *doesn't work* when the internal
termination in in place?

> The host in the MSTe is not at a T - it is merely at one end of the
> chain. Normally the internal drive should be terminated. However if,

No, this is not correct. This could possibly kill the adapter, and will
certainly not work with most drives. Believe me, I've tried this with two
MSTEs and three STacys.

Actually, 75% of the CT2-owners I know have serious problems (I know 4...), and from what I've seen on it I would not really recommend one. IMO (for what it's worth) it pushes the Falcon too far, I seriously doubt that any CT2-fitted Falcon will live that long. But this is just an amateur's opinon.

Get the Milan II. Or if you're lucky, get a cheap, second-hand Afterburner. It has a much faster CPU and doesn't push the Falcon beyond it's limits. It will also work with graphics-card.

As for the CT60 - RC promised a CT2TT if 50 people or more wanted it. A lot more showed interest but the project was silently killed. I don't think the CT60 will ever see the light of day (please feel free to search Deja News for my predictions about the Phenix...).

> can be easily customised on the boot disk. Any ideas???

Desktop wallpaper can be done with something like Deskpic 5, but TOS
has never had the ability to load wallpapers. On the Mega 4 Deskpic 5
would probably work quite OK, as the palettes are fixed (assuming you
just have the standard gfx modes!). I find it annoying on my Falcon as
I can never get a correct palette in 256 colour mode. Always the 16
system colours are 'altered'. In standard mono, 4, and 16 colour ST
modes it shouldn't be a prob, provided the palette of the pics is OK...

Magxdesk (needs MagiC), Thing, and other replacement desks of course do
a pretty good job of wallpaper...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

I use the Soundpool software. I'm very satisfied with the Audio CD
software. The other program for backups etc. has some problems at
handling of certain file names and when I make multiple backups via
image it creates the image new every time which is not very economic
but except that minor problems it works reliable too.

> Would any of these hardware/software combinations allow me to simply
> hook up an analog source to the CD recorder and record straight into

> it to the appropriate audio format, etc.?

The Soundpool software doesn't allow that but I wouldn't try it
anyway, at least not with CDRs because you know, one single buffer
underrun and your new CDR is only trash.

> Media:

I think the main difference is the price tag. But if there were any
difference the Audio ones would be the worse since the requirements
are lower there.

> they just eat it or beat it.

Dear Katherine, it seems that the main problem you and Rodolphe
have is not a technical one but that you have the same sort of
tempers. When something works it's the best thing imaginable
(I bought my CT2 after reading your review) but if there is
the least bit of a problem then it immediately turns the thing
into the greatest bit of shit on earth.

> Well, I know that Rodolphe hates me, and probably half of this newsgroup
> too, but honestly it does not really matter as I know exactly where I
> stand for.

That sounds a bit paranoid to me. Why should anybody hate someone
because of voicing a different opinion, but maybe it's because
deep inside you too think that your attacks aren't always fair.

> Rodolphe, I know you're probably going to try once again to threaten me to
> court for opening my mouth in public. Just know that I am ready for any
> action you might take.
>
> Now, I don't deny that Mr. Czuba has some customers that are actually
> happy, and I am really glad for them and somewhat shows that mr. czuba
> is not THAT bad.
> However, know that half of these "Satisfied" customers just shut up
> because of his bad attitude.

Why anybody should be sitting there trembling and not risking to
voice his opinion is entirely beyond me. After all I'm pretty sure
that Mr. Czuba is not the Boss of the KGB. But this technique of
yours to mouth accusations is exactly how Mr. Haider, is you have
heard of him, succeeded in poisoning the political climate here
in Austria.

> Please, real happy customers, speak up, and show your enthousiasm for
> centek/czuba, so other potential customers can see that I am wrong, and
> all would be fair. But at least, I would have spoken for the few too shy
> to say a word.

I'm really fed up with the 'too shy' people and even more with the ones who know what the shy ones would have said. In the last few weeks I must have read dozens of mails from people who 'know somebody who had troubles with his CT2' but not one mail of someone stating that he personally had troubles and what they were (or are).

Now that I have blown off my steam, I'd like to say that I would be really interested in knowing about the experiences of other CT2 users (what problems they have, or if there are none then for how long they used their CT2, since every once in a while I read : "now it may work but if you wait long enough you'll see").

just trying to bring the whole thing back to the facts which would be so much more of use

Gerhard

I think that MONO_OUT should be connected to R, G, B lines by resistors
(different value, each line) in order to balance a correct white colour.

A problem that needs a little work with a RSC file editor to reduce the length of those button texts.

The user defined colour box is odd as well, everyone seems to be getting different results with this.

Hopefully it'll come right in the next release, I've emailed Ulli noting these points.

You've hit the nail on the head. The GDPS protocol isn't for cameras (unless
someone writes such a driver!) :-)

There are other means of downloading pictures from a digital camera, but they
aren't as elegant as GDPS could be.

My experience as well. Rodolphe has always answered my questions, and by return of email at that. Whilst my main question (does the CT2 work with a Nova video card) remained unaswerable by him, some supplementaries had happier outcomes.

>as I am with my CT2 is the main reason that I'm not yet on the CT60
>list (I can't even remember the last time I had to put my Falcon
>back into slow mode).

I don't want to say "me too", but it is a phrase which exactly matches my thoughts!

I doubt that I'll join the CT60 list though, unless I had a second, unmodified Falcon into which to plug it in! :-)

>I'm ready to take the CDRW plunge, and would like some insights from
>those of you who have experience. I'm using a Falcon with Nemesis, TOS

You can certainly do all the jobs you want, but you'll need a sampler to be able to record analogue audio to CD UNLESS you just want to make compilation CDs from other CDs. In that case you will need a CD burner that is capable of reading digital audio, which your Falcon will most likely see as WAV files.

I have a Yamaha CDR400T recorder which works very well. Its 4* writing speed is probably about as good as you'll be able to attain on an Atari - it helps that you've got a Nemesis and an IDE drive, which you will most likely have to use to hold the intermediate buffer file for writing.

You can use either Soundpool or the Anodyne software, the latter also has long file support which the Soundpool lacks. Not something you'll be bothered about at the moment, but it's as well to be as futureproof as possible! :-)

Hope that that helps a little! :-)

In a way, yes. Another problem is that Fredi Aschwanden doesn't care to
fix any problem. Regarding the cache problem I can't guarantee anything.
When hardware addresses (SCSI in this case) are cached weird things can
happen since the signals the driver sees are not the signals actually
asserted by the peripherals.

I doubt he can. It doesn't matter whehter you have internal or external
devices: When SCSI hardware addresses are cached chances are slim that
it will work.

Draw the pic as a GIF on your PC, convert it to 320x200x16 colours. Copy it onto your ST, get hold of the program "Speed of Light" - view the image, play around with the colour gradiant sliders etc until it looks like you wanted, right-click the image and select "Save As" and you can save it as a Degas PI1/PC1 image.

They didn't do Space Hulk for the ST. Gremlin released Space Crusade and
HeroQuest as you already know, but that's about it.

> Heck, for that matter, what other GW games and/or utilities were done

Tell me, what is the definition of a beta-program?
AFAIK, in order to be a beta-tester for the Draconis package you first
need to buy the package. ROTFL.

I really don't think that 100 testers can bring the package alive. The
only way to get a proper and decent working package is by dumping the old
package and starting all over again.

The machines which were shipped with drives where setup by the
dealers as far as I know. So the dealer "thought the termination
was required". My TT was shipped with the termination removed
on the internal drive. If am wrong about dealers setting up
the machines, then Atari changed thier mind when they got to mine.

AFAIK, this has nothing to do with the motherboard. IMHO, the scsi-routines
are implemented in the Xilinx chip. All what Fredi has to do (maybe I see
it too easy) is reprogram that chip.

The scsi-routines of the Hades are not fully TT-scsi compatible, hence the
problems we have with HDdriver 7.7 and higher.
Correct Uwe?

Hi David,

I think your description of Atari SCSI is one the best I' ve ever read.

But I don't agree with
DL>Terminators have never been used on an ASCI chain.
for I owned a box in Megafile format that contained an ICD host adapter and two SCSI drives (1 hard disk and 1 SyQuest 44 meg), and if I remember correctly, that adapter and the later of the two drives were terminated.

Regarding any ACSI device as a black box, you're right. You can attach several devices one after another, maybe up to seven. For me three was the most to be attached to my former 1040 ST. And in contradiction to theory, my DMA (ACSI) cable usually had a length of 1 m...

Hi Clayton,

CM>Hardware:
I'm very satisfied with my Yamaha 8424 SCSI writer bought in Feb 2000.
There were up to now no problems of the kind "this brand of CDR can't
be written with that recorder". All misburnt (ho do you call in
English a not usable CDR?) CDs are due to my mistakes, not to the
hardware.

CM>Which CD recording software do people recommend?
I use CD Recorder 3.1 and am generally satisfied. The program dies
sometimes when configuring a CD, but luckily never when writing.

The Yamaha 8424 is a bit oversized, for a normal TT can't exceed 4X
writing speed.

Hi Ken,

KK>After I select OK, I get this message. This partition scheme is only
KK>valid for Big-DOS MagiC or MiNT
try again with 8 partitions (each less than 256 M) or run Magic,
BigDOS or MiNT before handling the drive.

KK>If I continue, I cannot access any of the drive letters.
That's quite normal if HDDRUTIL refuses to partition your drive. On my
TT that message wouldn't surprise me, but I think that should work on
a Falcon (TOS => 4.0)

KK>I did try this on a SyQuest 200MB removable. Everything works fine.
There any partition will be smaller than 256 megs. Alright!

btw: BigDOS will allow bigger and more (more than 14) partitions if
desired.

My 4.3 giga IBM drive is divided into 10 parts, 8 times 2.3 megs and 2
times 1 GB. The latter for CD writing purposes, but inaccessible after
booting plain-TOS (no BigDOS, no MiNT, no MagiC etc.)

I hadn't followed it up TBH, so I've no idea what the conditions were. If one does have to buy the package then yes, it's a strange way to attract testers. But at least they can be sure that the testing would be severe if money had been laid out! :-)

>I really don't think that 100 testers can bring the package alive. The

>MSTEs and three STacys.

Jo, I find your insistance on this to be very odd. I bought my MSTe
new in 1991. The internal Seagate 46mb was terminated, so clearly
Atari thought that termination was required. This drive worked happily
in this condition with the original adaptor for 7-8 years until I
bought a LInk96 and replaced the Seagate with a 1mb Conner, which is
also terminated. The Seagate still works perfectly (mostly with my
1040STF) and, as far as I know because I sold it, so does the Atari
adaptor.

For a brief time the Conner worked with the original Atari adaptor,
and certainly did not fry it, even though the former was terminated.

Which leads me to ask - what are you using for teminating resistors,
fencing wire? I have found that active termination works much better
than passive if you have three of four devices on the daisy-chain.

>I have my TT in a tower, and only use the internal SCSI-chain, so I can't
>comment on this.

There is no real distinction, apart from physical location, between
the internal and external chains. They form the one chain, but the
essential point is that, because the host driving elecronics is
connected somewhere in the middle rather than at one end, the chain
has two free ends where signal reflections can occur, and both ends
should be terminated.

You would have a tough time if you tried to use some of the
auto-terminating drives, because they insist that you terminate
correctly.

Well the demo allowed no access of the external SCSI devices like my Jaz
drive. I would imagine it would work since I did not have to turn off the
cache to use the utility program. It really would not matter anyway. I will
upgrade anyway just in case I need it.

You are right there Uwe. Fredi has not done too much for the Hades lately.
I asked him if he could write a driver for one of the Soundblaster cards
and he told me that he did not have the time. Kind of dum and un-supportive
of him. My Hades is still running strong and I will keep as long as it
performs. If anything seriously ever happened to it it will be Milan II
time.

I also own a Hades060, and I'm currently working on a project called
GSXB. GSXB is a "Generic Sound XBIOS" for all TOS machines. But, GSXB does
not drive any sound hardware by itself. For that, a driver is necessary,
as that makes it possible to write hardware drivers for new hardware
without having to modify the XBIOS all the time. At this time I have a
driver for the Ensoniq AudioPCI64 (SoundBlaster 64, or just PCI64, it
think they're also called) working great in my Hades. Aniplay, GemJing and
the old SAM config acc works fine at this time. GSXB will work on Milan as
well, but the Ensoniq driver will not, as it is Hades only at this time.
I've been working on this for about 4 or 5 weeks now, and things are
shaping up real nice :) Playback works GREAT, capture (recording) works
fine with SAM, but this is pretty "fresh" yet, as I got the recording part
working yesterday and thus haven't been doing many tests yet. the SAM conf
accc have been tested and works great with both recording and playback.

I'm not sure yet, but I think I will release this as shareware when it is
done. When writing this, I'm working on a Mixer program while listening to
mp3's with Aniplay, so I hope it won't be long now :)

> new in 1991. The internal Seagate 46mb was terminated, so clearly

True, my first MSTE also had a 48Mb Seagate which was terminated, and this
also worked. But I spent many hours trying to figure out why the new
Quantum LPS wouldn't work, until I removed the terminators. I thought this
was accidental, but I had the same problems when I upgraded a friends
MSTE. And a couple of years later, when I went to university and
discovered the internet, I found a document (in German) which explained
why a terminated internal drive could possibly kill the SCSI-adapter.

> Which leads me to ask - what are you using for teminating resistors,

Ordinary, original resistor-packs.

> should be terminated.

Which, in my case, does not work. The TT is terminated (as I said, I don't
have any external devices), but if I terminate the other end of the chain
no drives are recognised.

What kind of programs?

> to be afraid of pushing the system clock to 50MHz, but the Nemesis does
> the same. Double clocking the CPU seems to be a more common problem, as

From what I've seen the CT2 is a lot more radical than the Nemesis. The Nemesis simply speed up the system-clock to 20 or 25MHz, and feed the ACIAs with 500KHz clocks, but the CT2 apparently runs some parts of the Falcon itself at 50MHz.

> original Falcon still runs fine with the FX installed. Rodolphe bypasses
> this issue by placing a 50MHz 030 on the CT2 card.

Are these really 50MHz units?? Most Amiga-accelerators I've seen use 33MHz units overclocked to 50MHz. Anyway, this is not the reason for using a new CPU in the CT2. The real reason is that the original CPU is crippled and only has a 16-but data-bus, while a real 030 has 32-bit. This - together with local 32-bit RAM - is mainly why the CT2 is so much faster than a ordinary, overclocked Falcon.

What? That it's...

a) faster?
b) does not push the Falcon like the CT2?
c) works with a graphics-card?

> Afterburner. It just has to work once. Then there are no more SCSI problems

The Afterburner is a lot more compatible than most people think. I've had
mine for three years now, and I wouldn't dream of downgrading to a 030.

> e.g. And there is no fooling around with cache on/ cache off etc. and patches

Caches? Patches? You only need one tiny program, the AB-driver itself. The
CT2 has this in ROM, and as far as I can tell has caused a lot of
headaches for it's users.

As for the caches, I always run with all caches enabled, copyback-mode
included. And my SCSI works, as long as I don't enable my Nemesis as well
;-) I guess I can tune the Nemesis' DMA-buffer to work properly in 40MHz,
but that's simply too much work. The Afterburner itself has no problems in
40MHz, but my Falcon's SCSI has never been reliable with any of the
accelerators I've had (Speed Res. Card and Nemesis).

> everywhere. Not to speak that an Afterburner really "burns" ;-)

What do you mean?

> Did the people you know have the card installed by Rodolphe?

Only one, he's still not happy with it.

855. HDDriver 7.8 partition

Newsgroup: comp.sys.atari.st
Date: 2000-07-22 00:00:00 UTC
From: Ken Kosut <kjcat@execpc.com>
Message-ID: <3979b34d$0$10393$726baab@news.execpc.com>
Source record: 59431

Hello,

I recently purchased HDDriver v7.8

I would like to partition a CORE 2000 (2gig) formatted to DOS 7.x
I have Falcon 030 4 meg | 80 meg internal IDE | TOS 4.04

I use the SPLIT option in HDDriver to partition equally into 7

TYPE MBYTE

0 $0b 290.2
1 290.2 Platform: Windows
2 290.2 Bytes per Sector: 512
3 290.2
4 290.2
5 290.2
6 298.1 Mode x MByte

Files in root directory: 512
Capacity: 2040.5
Used: 2039.5
Free: 1.0

After I select OK, I get this message.
This partition scheme is only valid for Big-DOS MagiC or MiNT

CDEF for IDE
GHIJKLM for CORE

If I continue, I cannot access any of the drive letters.

Has anyone come across this type of problem?

I did try this on a SyQuest 200MB removable.
Everything works fine.
But I would rather use the CORE if possible.

thanks for any help and suggestions

ken

FamilyNet HQ: Telnet:\\www.family-bbs.net

I think what Gamer said is true. We are the spec on the wing of a fly that sits on the edge of the PC world. .
Another person said it best that if Atari was the popular computer, we would have new viruses plaguing us as well. .
The bottom line is, ST viruses existed at one time because ST computers were more common. Many hackers as I understand it liked the ST computer, and there has been a lot done with that. I think that a lot of old hackers would remember there ST days. Newer ones would laugh.
But for those ST hackers who have moved on, why would they want to bother with the ST world? Why spend hours of time on a virus or hack when only a few hundred will be effected on-line verses millions? .
As for the Atari on the net. Sorry, the Atari is using the exact same media.. the internet.. to get out into the world. So others could read what you are posting, and so forth. .
The only real advantage I see is a few.... .
1) Though the Atari uses a disk system similar to PC dos, it can't run actual PC programs.
2) Newer viruses tend to be written around newer platforms and programs. For example, the newer viruses were written to infect and launch from Microsoft Outlook. Even then you needed Visual Basic installed to run it.

>>notethat most complaints came from people who eventually fixed it by makinga
>>new installation and configuration of the HSMODA07 package.

I think that the new serial.stx (V1.20) has som hidden problem. It made trouble to me here (Mega ST4, TOS1.4- or 2.06, Intel144/144e modem) and sometime crashed in Dialer during or after initialization. Whether it would work or not depended on to which node of my ISP I was connecting- it seemed they used two different sets of software on their nodes, which did not respond in the same way during login and initialization (coincidence or not, the nodes with which serial.stx v1.20 had problems were those where ISP had 56K modems; the nodes with which serial.stx worked ok were those with 33.6K modems). The older serial.stx (V1.15) worked OK all the time.

I contacted Ronald too, and he has even sent me a STiNG suite adjusted by himself, together with configured HSMODA7 files, to be used from a floppy on a bare machine, but that crashed, too. So, for the time being, I am using old serial.stx v1.15 with STiNG V1.26 and it works.

Ronalds final comment was that one of the variants of my ISP's software somehow sent some wrong data during initialization, and there were also some doubts that maybe my modem did not have quite complete rts/cts protocol (true, the documentation is unclear, yet everything had always worked before) BUT IT REMAINED UNCLEAR why the older serial.stx was more tolerant to these faults. Hopefully some new version may clear that?

Which version of the Hades motherboard do you have?
There is a revision 2 of the Hades board perhaps the bugs are fixed in
the new board.

Yes, CDISO from Anodyne has a Rockridge option. I have never used it. Just what exactly is it? There is also another option for Joliet media. CDiso is a great piece of software that allows one to made ISO compatible CD's on an Atari computer that will be able to be used on most any other computer.

Well you could just get Magic or install BigDOS and that will solve your problems. But I have some size hard drive as you and what I would do is just partition your drive into 8 250meg partitions. That is what I am using now and it works fine and I am using HDDriver 7.61. I have used the demo of 7.9 and it works fine with this setup.

Hey Jo,

I have seen this post before. I think this guy has "penis envy" of people that actually have an Afterburner:) A CT2 isn't much faster than my Mighty Sonic running at 40Mhz.....And my Afterburner puts it to shame, and is just as compatible. The Germans had problems with the AB due to poor distrubition and decent documentation, which Doug released in English. Kind of opposite of what normally occurs in the Atari world.

allo
yes, I did the same. Woller received my money via credit card two months ago,
yet nothing received so far. He said three weeks ago that he would check his UPS
statements, yet I have heard nothing from him since.
He did send me nAES 1.17, so I thought it would not be a problem with nAES 2.0 on CD-ROM.
maybe I was wrong. (hope so) I will send one more e-mail and see what comes of it.
wish I could get nAES from a local dealer, but now just wish I could get nAES period! :-)

I use EASEL/ST from Computer Fenestrations. It loads a
background picture in one of the three regular resolutions. I
don't know if it supports any of the higher rezs.

Mark,

My E-Mail has been very quite lately not sure if its working right
so if you tried to send the drivers, please try again..:)

I have put together a driver disk for the Epson 400/600/800 stylus
colour, I will e-mail you a copy. All major software drivers
ps2.2, calamus etc

Mark Bedingfield

Thanks again, Donner.....

Peter,

Sorry - I was being a bit sloppy in my writing. I tend to think to anything on the SCSI side of an ASCI to SCSI adaptor as SCSI, even though Uwe would remind us that it isn't real SCSI. Thus I wrote of the MSTe's internal SCSI termination, even though we know that it is firmly attached to the ASCI bus via the adaptor.

I never got past two ASCI devices, a SupraDrive FD-10 and a Supercharger, and even the FD-10 was SCSI with its own ASCI/SCSI adaptor.

Although I said that I would shut up, I must tell Lonny that by 1991 most Ataris sold in Australia were going out via music shops that wouldn't have known a termination resistor if it bit them. Also I think all MSTes sold here had a factory fitted hard drive.

I reccomend you get him to send you the UPS tracking number. Then you can
track the package yourself with UPS. If he is unable give the number then he
did not send it.

Hi Ed,
Hope you received my scripts by E-mail.
I sent you Default CFG, Dial SCR, Hsmodem7 settings and Route Tab.
Let me know if you've received them!
Your problem of an incomplete connection sounds like the one I had when
I used Hsmodem 6 instead of 7 (when I upgraded to Sting 1.22/Dialer 1.16.)

Hello, I already e-mailed you the following list. I'll mention them again
here, maybe more people are interested.

```
Here are some astronomy prg's from the PD collection of the Dutch Atari
Society :
>A 143 Ephemeriden II
A 151 AstroCal
A 198 Astrolabium
A 215-218 General catalog
A 301 2nd Star, Astropho, StarFind
A 429 StarMap
A 533-534 Sidum Astra nieuwe versie op A 589-594
A 544 SAT402
A 564 SkyMap
A 675 Eclipses
A 707 Voyager 3
A 729 Astro Guide (hypertext)

You can order them at :

Ronald van der Kamp
secretaris Stichting ST
atarist@xs4all.nl

In English, we call misburnt CDR's: coasters. A coaster is a little
piece of wood, plastic, or paper that you place on a table to put your
drinking glass on. It keeps the moisture from the table top. The CDR's
become coasters because that is all they are good for after you screw
them up...

For example, I have the Falcon Heatseeker interface for the SLM laser printer. The driver that comes with it works with Speedo 5, but not with NVDI. But Centurbo won't run Speedo at full speed (unless you run Speedo under NVDI, which causes other problems), so I have to run unaccellerated when I want to run the SLM.

Nemesis runs the 32MHz parts of the Falcon at 50MHz, and the 16MHz parts of the Falcon at 25MHz (in the last Nemesis release).

> ordinary, overclocked Falcon.

This is correct, and is also the reason the FX Board could not overcome the 14MB RAM limit. It is a good question on the CT2 CPU, but I don't feel like opening mine again to see! ;)

Hi!

Agree!
Wouldn't it be possible to make a hardware hack here?
Perhaps just some chip enable signal that could be connected to the TCI?
Just a wire? I dunno, just thinking...

Cheers

/Peter

While we're on the CDR subject, has anyone tried a Panasonic CW-7502 with either software package? I own two -- one runs fine under Toast on my Mac, the other is currently functioning as a CD-ROM on my Falcon while I try to figure out how to get it to record!

|people and myself.

Support is very important and stability also. Speed is all relative
in that a bloated program needs a superfast computer - lean
programs, which, by and large, Atari programs tend to be, work
quickly with slower computers. Certainly for word processing
scrolling sometimes can be too fast. I have a Hades but have been
having problems with the SCSI interface and at present I intend
buying a Milan II rather than a pc and emulator.

|
| Jo, I find your insistance on this to be very odd. I bought my MSTe
| new in 1991. The internal Seagate 46mb was terminated, so clearly
| Atari thought that termination was required. This drive worked happily
| in this condition with the original adaptor for 7-8 years until I
| bought a LInk96 and replaced the Seagate with a 1mb Conner, which is
| also terminated. The Seagate still works perfectly (mostly with my
| 1040STF) and, as far as I know because I sold it, so does the Atari
| adaptor.
|
| For a brief time the Conner worked with the original Atari adaptor,
| and certainly did not fry it, even though the former was terminated.
|
| Which leads me to ask - what are you using for terminating resistors,
```

| fencing wire? I have found that active termination works much better
| than passive if you have three of four devices on the daisy-chain.
|
| >I have my TT in a tower, and only use the internal SCSI-chain, so I can't
| >comment on this.
|
| There is no real distinction, apart from physical location, between
| the internal and external chains. They form the one chain, but the
| essential point is that, because the host driving elecronics is
| connected somewhere in the middle rather than at one end, the chain
| has two free ends where signal reflections can occur, and both ends
| should be terminated.
|
| You would have a tough time if you tried to use some of the
| auto-terminating drives, because they insist that you terminate
| correctly.

I am fairly new to the Atari platform (although I've known about it for quite some time), so please bear with these questions...

What is the newest version of the GNU compiler for the atari st? (the newest I've seen is 2.72).

Where are the binaries of the GNU compiler components available?

What are the basic components one needs to download to have a *useable* GNU compiler?

Can anyone point me to a recent installation guide (I found one for pre 2.x, but found it difficult to follow
as the file names were different).

I've searched for this info on the web and have not found anything useful yet. I'd appreciate your help.

Hello Mikey,

M>I have seen this post before. I think this guy has "penis envy"

Hey come on, is /that/ what you call serious discussing??
What I mean is for example that most games won't run with an AB. And any program that needs a 030 etc. I'm not at all envious of anybody's AB; not to mention that at least in Germany the AB had the double price of a CT. If that's different at your country, lucky you.

So just stop these stupid jokes.

Henrik

Hi Lonny,

LP>Is the Yamaha 8424 the same as Yamaha model CRW8424SXZ ?
I think so, it's marked 8424 on the front of the drive, and it's a SCSI drive.

LP>I have a TT also and am looking at getting this drive.
It's a good one, as far as i can judge, for five months is not too much experience! I think the 6X Yamaha would have done the same job in the same way, but would have been a bit cheaper.

I spent 500 DM (~240 $-US?) for the bulk drive, just drive and manual.

Und TTschï¿½

A member of our local Atari user group uses the EZCalc spreadsheet from
Royal Software, and has a few questions about the program.

1. Is there a way to calculate standard deviation with EZCalc?

2. Is Royal Software still in business, and if so, how may they be
contacted?

3. What is the most recent version of EZCalc?

Any advice on the above points would be much appreciated.

Hi Atarians:

Brian Becroft has asked me to post this. The original posting was on
Atari-Midi Mailing Grp. Please repond directly to Brian on this subject.
<brian@gem.win.co.nz>

Thank you

Tim Conrardy

From: Brian Becroft <brian@gem.win.co.nz>
Date: Fri Jul 21, 2000 3:23pm
Subject: Master Tracks Pro + Port B Box

Hi there list members, my first message to this list, and I hope I have
got the posting procedure correct, so this is a bit of a test, but also
a
message that we want feedback on.

We recently had a request from a two Musos who use Master Tracks Pro and
wanted to know if Mario's MIDI3 box which suits Notator would work for
Master Tracks Pro.

We have looked into it and have ended up making a suitable Port B Box as
the the MIDI3 operates differently.

We were wondering if there is anyone else who would like such a box and
so make the project more financially feasable.

I hasten to add that the simple DIY Port B Box does not work with Master
Tracks Pro, this box is a complex circuit beyond a DIY approach, but
necessary to have a working unit.

So this unit is costing $80 (usa dollars), and while I am about it,
please
don't reply complaining about the cost, this is a fact of the low
production, but worth it for Atari aficionados. Maybe there is a unit
now
available that works with Master Tracks Pro, then please post about it.

What we want are orders as I am actually making this unit as I speak.

If you have any suggestions of other lists where I could post this info
about the Master Tracks Port B Box then also, please post up your help.

If you would like to hear the inside story of this project then post
here

saying so and I will post up the interesting saga.

Incidentally, this is being typed up on Mario's TT030, using his newly developed graphics card running in true colour on a 21" Radius high quality graphics monitor...

My Falcon's SCSI never was reliable before installing an accelerator.
I spent quite some money for 'clock patch' and various HD drivers.
Since Rodolphe installed the CT2 SCSI works reliable for the first
time !

Okay. You have your AB and you're happy with it. Nice for you.
But to say that a 040 is more compatible with a 030 than a 030 ???
And why is there a special MiNT kernel needed for AB for example ?

I would suggest stopping that 'mine is better than yours' or worse
sort of postings. Okay ?

I have a Falcon with 4.04 TOS and use HDDRIVER 7.8 too. The following
configuration works fine here :

IDE with CDEFGHIJ (Type BGM, 1GB each) KL (Type MIX, 2GB each)
SCSI with MNOP (1GB each)

So if you compare that with yours neither the number of partitions
nor the size can be the problem. But maybe it's the partition type

you have to set to BGM for the TOS partitions ?

We have a couple Robokits left in stock. I think they are $49.95
and include the interface PCB, extensive manual and driver disk.
A copy of the driver disk would be $15. + shipping.

Yes, this is correct. The Hades doesn't have the SCSI/DMA chip the TT
has. And as far as I can tell the Hades is also not compatible because
SCSI hardware adddresses are cached. This is something you must not do,
regardless of the platform.

TOS doesn't support Windows compatible partitions larger than 32 MByte.
So HDDRUTIL is correct in telling you that additional software is
required.
You should use the TOS compatible partitioning mode.

Don't ever edit the partition type if you just want to create standard
DOS or TOS compatible partitions. You should only edit the type in order
to create F32, LNX, MIX or other non-TOS partitions.
Ken's problem is that he use the Windows compatible partitioning mode
for large partitions. TOS cannot access Windows compatible partitions
without additional software like MagiC or MiNT being installed.

This sounds really weird... Do you say that you can use the Heatseeker
with NVDI+Speedo and full speed, but not with Speedo alone? Really weird
indeed.

> Nemesis runs the 32MHz parts of the Falcon at 50MHz, and the 16MHz parts

Not really. On the Falcon, the only parts that use the system-clock
undivided (i.e. 32MHz), is the Videl (pixel-clock only, the rest of the
Videl runs at 1/2 system-clock) and DSP.

> of the Falcon at 25MHz (in the last Nemesis release).

Apart from feeding the DSP separately, the only thing Nemesis does is to
replace the original system-clock with a faster one. This means that the
Falcon's original timing is kept, it's just faster (except the ACIAs,
which needs a 500KHz clock to function normally). The CT2 goes further,
although I don't know the details I've been told that some components are
modified to access the bus at higher speeds than it normally would by just
increasing the system-clock to 50MHz.

Janka Gerhard <gerhard.janka@siemens.at> wrote:

> But to say that a 040 is more compatible with a 030 than a 030 ???

Hold on now, that wasn't the issue here. You said that the *CT2* is more compatible than the *Afterburner*, and there's a lot more to these accelerators than just the CPU.

> And why is there a special MiNT kernel needed for AB for example ?

Because the 040 MMU is different from the 030 MMU. But if the CT2 is so compatible, why doesn't things like Outside or MiNT's memory-protection work? Because the CT2-driver use the MMU to remap the fast-RAM. There are also other problems related to the use of fast-RAM vs. ST-RAM which applies to both the AB and CT2.

(I could mention that the AB-driver does the same...)

As for the 040 vs. 030 I can assure you that this is mostly an academic question, in real life they're very compatible. The 030-FPU is emulated with great success (and speed), and I can't say that I've found anything that won't work. Caches *can* be a problem, but by switching from copyback mode (which doesn't even exist on the 030) to writeback (a lot slower, but this is how the 030 does it) you'll eliminate these.

It's hard to find Falcon-software that doesn't work on the AB, the exceptions are demos and games which relies on the timing of a 16MHz 030. If you want to use these you must install an AB<->030 switch for 100% compatibility.

Alas, whoever compiled these had a very (exclusive ? typical? ...?) MiNTish attitude: these utilities do not work on plain TOS (trying to run them as TTP gives "unknown application: virtual memory exhausted" message). Even with MultiTOS they do not run quite correctly but report corrupted .ZIP files when there aren't any; maybe they need both MiNT and another filesystem...

Which is a pity, as I suppose that there is no particular need for the utilities that run on practically any OS on Earth to be MiNT-only on Atari, which is proved by their older versions (zip 2.0 and unzip 5.13) that work quite happily on TOS. I do not try to diminish the amount of effort involved in porting these utilities, but this seems... well... somehow self-centered...

Hi everyone,
My ISP have had huge problems with their personal website servers, so there have been lots of problems accessing my website lately.
To you who tried reaching it without success: try again. I've moved the site to one of all those free webspace providers and hope it'll work nicely there until my ordinary ISP gets their stuff together and can make a promise this much problems won't come back... I love redirecting of web addresses - that way I'm free tomove anywhere, keeping the same address :-))

Oh, by the way - I've reached over 15000 visitors - not bad for a site that's mostly about Atari and Falcon in particular. Well - my studio and some magazine articles I wrote are also there, as well as many other useful things... There's also a new feature with a discussion board primarily intended for Atari and music related things - my hopes are to be able to make a big data base out of all problems and let everyone read about how the solutions are found.

www.holmerup.com is the place to visit.

Best regards,
Claes

Newer versions are 2.8.1, 2.91.66 and 2.95.2. While I had no
troubles installing 2.8.1 (there's a very good installation guide
comming with it) I somehow didn't succeed in getting the newer
ones to work (i.e. they compile my programs but except a
'hello world' test program none of the resulting programs did work.

> Where are the binaries of the GNU compiler components available?

I think 2.8.1 you'll still find it at
ftp://ftp.rz.tu-harburg.de/pub/suftware/systems/atari/gnu/gcc

> What are the basic components one needs to download to have a *useable*

Ah, so the problem isn't that Speedo doesn't work, but that the built-in
VDI doesn't work (probably because the blitter doesn't work at high
speeds). That makes sense.

No wonder. You are talking about windows, not about the power which the CPU provides. Install a real operating system and watch how an intel CPU *can* provide very decent performance.

It's possible that there are operating systems with faster GUIs than
Windows, but X/unix (the only alternative with some half-decent apps) is
definitely not. Windows might suck, but so does it's usable alternatives.

Have you tried Beos? It works very nice even on slow PCs.

Even if you could not find a suitable OS, then it is still not viable to
rate the CPU performance based on windows.

Not necessarily. IIRC, there was even a note from atari describing that the
internal SCSI drive in a MSTE should *not* be terminated.

It *may* work if terminated, but the drivers on the original Atari MSTE
internal "SCSI" adapter are too weak and are overloaded when driving even a
single terminator (the adapter itself does not have termination but only
pullup resistors).

>Which leads me to ask - what are you using for teminating resistors,
>fencing wire? I have found that active termination works much better
>than passive if you have three of four devices on the daisy-chain.

How are you connecting more than one device to the MSTE internal adapter?
without modifying the PCB, it can only handle one SCSI device (at ID 0).

>You would have a tough time if you tried to use some of the
>auto-terminating drives, because they insist that you terminate
>correctly.

Huh? Which drives are auto-terminating?

I only know auto-terminating host adapters (which have to use a method which
is in violation of the SCSI-2 spec, and only works because they detect how
many connectors have cables attached), however, I would not know how to
design an auto-terminating device with just one connector.

This could be easily fixed in software if the hades TOS would initialize the
PMMU correctly.

Hello,
There was a mistake in the url (mentioned here recently) of the site
of the astronomy prg "Universum". It should be :

http://altern.org/wim15041977/universe.htm

The new version: Universe 0.51 from 6 feb 2000 can be downloaded there.

Cheers,
Dan

There have been complaints about Woller Systeme here recently.
I'm very glad you've decided to watch this newsgroup as it will
make it much easier to keep in contact with the only source of
certain Atari-based items.

>>except web browsing.

I don't know what you use your machines for, or how you've configured
your PC, but my old K6-3/400 was a _lot_ faster than my Falcon+AB040
at 32 MHz for just about everything I did with it. YMMV, I suppose.

Needless to say, my brand new Duron/650 is even faster. According to
WinTune 98 it does 1993 Dhrystone MIPS (that's the 'standard' VAX MIPS,
which is probably (at best) what Motorola are talking about with their
100 MIPS figure for the '060 (that was never a good benchmark, though)
and 809 Whetstone (a floating point benchmark from around the same time
as Dhrystone) MFLOPS (far faster than any Motorola 56k DSP (and those
don't even do floating point) and that's without using the 3DNOW!
'DSP instructions'.).
I bought a rather expensive mainboard and a 650 rather than 600 MHz
Duron (noone in town seemed to have the cheaper one), and it set me
back $350-$400 (including our 25% tax).

>Milan Computer. I don't think that ST-ZIP is a real good test
>(BTW, the Athlon was about 8x faster) in that archiving via ZIP
>is very math intensive and is one of the places where chip speed

Actually, I'm not so sure the chips' speed had much to do with that
time difference. The Athlon/600 may be fast, but I have a really hard
time believing that it could be eight times faster than an '060 under
emulation (see also below).

The PC likely had good disk write caches (most people have that turned
on under Windows, but few people use it on Atari's, IME) and a faster
HD (which wouldn't have mattered much), and that could have made a
significant difference.

Also, and perhaps most importantly, even though I don't know any French
I think it looks like _another_ archive was used for the testing under
MagiCPC (well, I guess the archive used in the original test isn't
publically available). That could make a lot of difference.

>really matters. In the other tests the results were mixed (I'll

But that was GEMBench!
You should _never_ use GEMBench to get any kind of performance
indication that has anything to do with reality.

That said, the GEMBench numbers do of course mean _something_ (well
some of them do, and not always what you think ;-), although you need
to be very careful interpreting them.

Below I'll be comparing the posted MilanII and MagiCPC benchmarks
with a few others. I'll be giving three different MilanI numbers,
since I don't trust the statement that the ones given were really
versus a Falcon _with_ NVDI. The MilanI numbers will be given in the
following order:
1 - As posted on the official site, claiming to be versus Falcon/NVDI
2 - From the net, preproduction MilanI, no comment about whether NVDI
is used on the MilanI, but the numbers are versus a non-NVDI Falcon.
3 - Calculated from MilanI/NVDI timings sent to me via email, definitely
versus a Falcon _without_ NVDI

The STEmulator numbers are from an old demo version (v1.40), running on my
Duron/650 with an nVIDIA GeForce SDR. 1024x768x256 GDI window mode was used.
Some of these tests went by so incredibly fast that timing inaccuracies
(the time is given in 1/200 s increments and a couple of tests completed
in as little as 2-4 'ticks') cause significant variations between runs.
Also, I had to calculate some percentages by hand, since GEMBench
thought they were negative...

My Falcon numbers are from a 32 MHz AB040 with an Eclipse/RageII graphics
card using fVDI (and sometimes with fVDI+NVDI numbers given), running
under MagiC and/or TOS (I don't have a good way of turning on the
copyback cache under MagiC and for a couple of tests that mattered a bit).

All my own numbers are versus a Falcon _without_ NVDI.
If the Milan numbers can be shown to actually be versus a Falcon _with_
NVDI, some of my comments regarding the relative speeds will of course
not be valid.

> Gem Dialog Box 3350% 3350% X1

Strange that both should get the same numbers there.
The Milan number also sounds a bit too high, considering what it manages
on some of the other tests.
Perhaps the grow-boxes were turned off? That can actually make a
very large difference in this test.

I get 1472% on my Falcon+AB040 with an Eclipse/RageII (with grow-boxes).
Only 822% under TOS 4.04, though, so this is actually very dependent
on the AES.

MilanI 2528%, 2576%, 1089% (Grow box differences?)

STEmulator 507%
Apparently there's something here that the STEmulator VDI doesn't like.

> Vdi Text 14900% 7842% X1.9

5730% for me (3820% with NVDI doing the actul text rendering).
A faster processor does not matter nearly as much as a faster bus.
My '040 machine is crippled by having to go via the extremely slow
Falcon bus to reach the PCI card.

MilanI 3547%, 2483%, 3386%
Except for the preproduction numbers, these are similar enough, and
not too different from what I get with fVDI+NVDI.

STEmulator 37243%

> Vdi Text Effects 8878% 3488% X2.5

I get 6369% (4013% with NVDI doing the rendering).
Hmm. Does that mean that a 32 Mhz '040 is faster than a 66 MHz '060?
;-)

I'm rather surprised, really, that the other two machines don't do
better.

MilanI 2817%, 485%, 2525%
Again, the official numbers and the ones that are definitely versus
a non-NVDI Falcon are quite similar. The preproduction machine seems
to have severe trouble with text effects.

STEmulator 22535%

> Vdi Small Text 7750% 5636% X1.4

6200% here (3444% with NVDI). :-)
fVDI is really good at small text (since I use that a lot ;-).

MilanI 2638%, 879%, 2480%.
As above.

STEmulator 61992%

> Vdi Graphics 2672% 816% X3.3

Ah, I'm actually getting 4638%.
Yes, that is five times faster than the MilanII. ;-)

I've not seen a Milan run this test, but I'd imagine that it's the
circle filling that takes too much time. That operation is currently
heavily hardware accelerated with fVDI/RageII by drawing the circle
as a filled polygon (the subdividing algorithm is taken straight from
the recently GPLed VDI code, but with the default number of lines it
doesn't look quite as good as a proper circle (I'll make this
adjustable later, as well as add support for 'perfect' circles)).
I don't know if the Milan VDI uses hardware acceleration for polygons
(doubtful), but I'd be interested in some VDIBench numbers (see my
WWW/ftp site (it's included in the latest fVDI archive, IIRC), but
don't try to run the blit tests (they are buggy)) numbers.

MilanI 552%, 569%, 546%
All pretty much the same here.

STEmulator 4638%
(Strange that it should be exactly the same as my Falcon.)

> Gem Windows 1071% 1829% X0.6

Funny that. Note though, that under a multitasking OS the background
will be redrawn after each window is removed, so you have to be very
careful with what you have on the screen to get good numbers...
3000% under MagiC (nothing beneath the window) and 1271% under TOS 4.04
on my machine (again major dependency on the AES).

MilanI 1315%, 1500%, 652%
Probably some difference in the window background.

STEmulator 1666%

> Integer Division 2966% 853% X3.5

Efficient processors at high clock frequencies do of course make for
very fast divides. The emulation part doesn't get in the way as much
here as elsewhere.

331% for me.

MilanI 258%, 260%, 257%

STEmulator 3664%

> Float Math 184% 922% X0.2

MagiCPC apparently doesn't emulate the FPU.
Not that this test really doesn't test the FPU on an '040/'060, but
that's another story...
It would be interesting to see some results from the MilanII without
using the FPU, since that would actually be a pretty good integer test.

267% here.

MilanI 377%, 395%, <something must have gone very wrong with this test>

STEmulator 95%
So, STEmulator seems to be about half the speed of MagiCPC on general
integer calculations.

> RAM Access 8050% 4025% X2

Impressive!
I'm only getting 1431%.

MilanI 1238%, 1288%, 882%
Don't know what the last machine could have done wrong here. The number
looks far too low.

STEmulator 4600%

> Rom Access 2045% 2812% X0.7

I wonder why that would make a difference for an emulator?
Anyway, 1000% here.

MilanI 882%, 882%, 625%
Again something strange with the third machine.

STEmulator 3214%
Also significantly slower that RAM accesses.

> Blitting 8285% 106% X78

The emulator number is what one would expect, since there is no
fundamental difference between screen and RAM accesses.
(This test only does screen->RAM and RAM->screen blits.)

Does anyone have any idea why the Milan number is so incredibly bad,
though? I mean, that machine is supposed to have a fast PCI bus!
I'm getting 112% with my crippled bus!
(Turning on the blit caches in fVDI brings that up to 4971%.)

MilanI 82%, 84%, 81%

Again very low numbers!
According to GEMDemo, a MilanI can do RAM->screen blits much faster
than a Falcon+AB040+Eclipse/RageII, but perhaps their screen->RAM
blits are _really_ slow?

STEmulator 7565%
STEMulator probably makes use of some kind of Windows graphics function
here, while the RAM access test needed to be done by emulated code.

> Vdi Scroll 15789% 4106% X3.8

Not too bad for the Milan, although I get 5263%. Probably mainly
depending on the difference in graphics cards.
I wonder if MagiCPC uses the Windows functions for the scrolling, or
if it gets such high numbers the 'hard way'?

MilanI 2970%, 3225%, 2857%

STEmulator 6000%
Not terribly good, for some reason.

> Justified Text 4418% 833% X5.3

I really can't see how the Milan number can be that low.
Perhaps its VDI fill function isn't good enough (this test is completely
fill rate limited on some hardware, since it clears the entire window
between successive text displays...).

For whatever reason, I'm also getting those 4418% (1881% with NVDI).

MilanI 1727%, 969%, 1638%

STEmulator 10000%

> Vdi Inquire 4555% 3727% X1.2

This is actually the only test I even somewhat like about GEMBench.
I consider it a pure processor/VDI dispatch speed test rather than a
graphics test, though. ;-)

I'm getting 1640%, which doesn't seem out of line with the MilanII
number (fVDI and NVDI are similar here).
If the NVDI5 version used with MagiCPC doesn't 'cheat' (and uses any
native x86 code internally), the Athlon numbers suggest that the
PC running MagiCPC is indeed somewhat faster, if not a whole lot, than
the MilanII on 'normal' integer code.

MilanI 1518%, 1413%, 1025%

STEmulator 5125%
Faster than MagiCPC here, but it may well be using some x86 code.

> New Dialog 2442% 610% X4

This is normally screen->RAM->screen blit limited, since the background
has to be saved and restored. So, the MilanII and my machine, with their
bad blit numbers, do indeed perform rather poorly.
I have 394% without blit caching, and 1068% with (there might be a
difference regarding grow-boxes here too).

MilanI 458%, 460%, 384%

STEmulator 647%
Possibly grow-box related, since STEmulator is decently fast at
blitting, as seen above.

> * compared to a falcon in 640*480*8bits and NVDI5

Going by the MilanI numbers above, I kind of doubt that.
Please, feel free to post numbers to prove it, though.

945. Modern Epson Printers Update

Newsgroup: comp.sys.atari.st
Date: 2000-07-25 00:00:00 UTC
From: atarigalen <kNOkSPAM@uia.net.invalid>
Message-ID: <085fdc84.cc9d9a16@usw-ex0107-055.remarq.com>
Source record: 59328

Modern Epson Stylus Color Printers and Ataris

As I mentioned before, the Epson Stylus Color 660, 760, and 860 use ESC/P Raster instead of ESC/P2 commands. Consequently, there was/is a serious concern on whether these printers would work with NVDI 4/5.
I finally found some information on the Epson website. In summary:
Stylus Color 660: Not recommended. Might work, particularly in ASCII dump mode.
Stylus Color 760: Will work to some degree. I expect 360dpi color and black are likely, with the 720dpi mode possible.
Stylus Color 860: Will work to some degree. I expect 360dpi color and black are likely, with the 720dpi mode possible, but unlikely, considering the pessimistic tone of the "tip".
Of the three printers, the Stylus Color 760 is the most promising. On the other hand, the HP deskjets are KNOWN to be backwards compatible at least to 600dpi black and 300dpi color.

The moral of the story: Unless the Behne brothers get busy creating NVDI 6, the Epson Stylus Color 740 and Stylus Photo 750 are the last two available printers that will definitely print color at 720dpi on the Atari series of computers. The current HPs are limited to 300dpi color and 600dpi black and the new Epson Stylus Color x60 models are of unknown compatibility, though 360dpi (at least) is likely.

Here are the quoted "tips" from various places on the Epson website:

Regarding the Stylus Color 660:
Troubleshooting Tip #0121
Printing from DOS / ESC Codes / Older Applications

The Stylus Color 300/400/440/640/660 and Stylus Photo series inkjet printers are not DOS compatible. Unlike other EPSON models, they are designed primarily for Windows therefore will not accept printer ESC codes. These Stylus Color printers use ESC/P Raster language and the LQ models use ESC/P2. The difference in the languages prevents the printers from emulating the LQ or any other models.
You can try selecting one of the following Epson LQ models in your driver selection, but the results may not be positive.

LQ-2550 (color)
LQ-860 (color)

LQ-850
LQ-510
LQ-500
EPSON 24-Pin Compatible
EPSON Compatible
24-Pin Dot Matrix
Dot Matrix

Regarding the Stylus Color 760:

Troubleshooting Tip #0245
Printing from Windows 3.1 or DOS

To print using Windows 3.x, DOS applications or from the DOS prompt, D4 Mode of the parallel interface must be disabled (OFF).
Take the following steps to set the D4 Mode:

1. Turn on the printer while holding down the Cleaning button.
2. The paper out light will start blinking.
3. Release the Cleaning button and immediately press the Load/Eject button and hold it for about 20 seconds.
4. The Paper Out, Color Ink Out and Black Ink Out LED's will light.
5. Release the Load/Eject Button.
6. Press the Cleaning Button and observe the LED conditions as follows to select the desired D4 Mode:

Paper Out LED - ON = D4 Mode ON
Black Ink Out LED - ON = D4 Mode OFF
Color Ink Out LED - ON = D4 Mode AUTO

NOTE: Be sure to set the D4 Mode to AUTO for Windows 95/98 operation.

Regarding the Stylus Color 860:
Troubleshooting Tip #0123
Printing from DOS applications

Since most DOS applications were developed before this model printer was designed, they will probably not provide a specific printer driver for this model. Instead, you can select an alternate driver from your DOS program if available. This printer and driver is designed to work with Window applications and therefore DOS applications may not work properly in every case.

For color & monochrome printing select:
LQ-2550 or LQ-860 if available.

For monochrome printing only select:

LQ-850
LQ-510

LQ-500
any other LQ- model
EPSON 24-Pin Compatible
EPSON Compatible 24-Pin Dot Matrix

That only works with external cases, not with a naked SCSI drive with a
single 50-pin connector.

>drive from my MSTe, was to hold HD-Driver. When I relied on the
>Seagate's resistors to terminate the chain, I would get strange errors

Did any of the drives have non-SCSI-compliant 25-pin connectors? If yes,
then using active termination may lead to better results.

SCSI-2 specifies active termination for FAST-10 (and faster) interfaces.
Even if the TT's SCSI ports only runs asynch SCSI, you still get the steep
edged and the resulting increased reflection problems when using passive
termination, bad cables etc. with such devices.

I once tried Spectre GCR on a Megas STe and got nowhere. I was
eventually told by the supplier (who had said it would work) that
the problem related to the length of leads plus track to the drive.
I don't remember it all now but there was something about the Mega
STe in particular.

<snip> (more and more numbers)

I suppose in the long run, the numbers really do not mean anything because we will continue to keep using the computers we are comfortable with until we are not comfortable with them anymore. For myself, since the internet is the main computing activity I do anymore, and since this is the one thing the Falcon doesn't do well, the Falcon rarely gets turned on anymore, and the PC does most of the work here now. But when I do have occaision to use the Falcon, I always appreicate how fast everything goes. Also, TigerDirect just sent me an offer of $150 for an Athlon 500 with motherboard, so I just ordered that.

I just pulled mine from a PC. I don't think it is low profile. You can
search ebay, and many of them have pictures, so you can determine the
height. I found ebay sellers quite helpful when sent questions about size
and specs that were not apparent from the listing description or photo.

That's correct. I had a TT that had the same problem. Correspondence with Gadgets tech support revealed that the mac mode does not work with 1.44 equipped computers. The TT had the further problem that even if I used the original 720 drive (mine was an early TT), you had to install a circuit board patch on the Spectre to work correctly with the TT's 16Mhz motherboard. Since the Mega STE only runs the CPU at 16MHz, this should not be an issue for you.

The Epson Stylus Color x00 and x40 printers are ESC/P2 class
printers and all use the same driver, which is a (compatible)
superset of the dot matrix ESC/P printers. So is the Epson
Stylus Photo 750. The Epson Stylus x60 printers are ESC/PRaster
class printers and all use a different driver. They are NOT
ESC/P2 compatible (but I rather suspect they are ESC/P
compatible, hence my predictions of the 360dpi color and black
modes).

I'm not sure about the TT, but since each 1x is 150K/sec and the
Falcon's SCSI bus is roughly 2M/sec, there is clearly no use for
a CD over 13x on the Falcon. My personal experience is that my
8x drive seems to have to wait occasionally. In any event, I
get almost identical read times from my 8x CD as from the HD.

No argument. Did anyone say otherwise?

>Did any of the drives have non-SCSI-compliant 25-pin connectors? If yes,
>then using active termination may lead to better results.

We are talking about ATARI computers, aren't we? The last time I looked at my TT the SCSI port was a 25-pin D Plug. So were the ports on the ezFlyer. Most external SCSI drives were intended for the Apple, which started the 25-pin SCSI idea.

However, we are drifting away from the point. This thread started with a request for help. A number of people offered advice based on their own somewhat odd-ball experiences. Uwe Seimet then stepped in with a comment for which he was criticized. However I think that he was misunderstood. He did not say that people should change such strange termination schemes as they had found to work in their own circumstances. He did say that they should refrain from offering such schemes as advice to others because they will almost certainly only mislead the person seeking assistance.

I tried to support Dr Seimet by relating my own experience of quite a variety of setups on TT and MSte (the latter with Atari, Supra, Link 97 and Link 96 adaptors). In all cases I found that, if I terminated according to the rules, the setup worked. If through misunderstanding, error or oversight I did not, I suffered disk errors, sometimes catastrophic ones.

My comment about active versus passive termination was only incidental to the above.

Ahhh, I suspected as much. So, here is my question:

Given that the Mega STe has an internal 1.44 am I hosed? OR can I hook
up an external 720 and just run floppies through that?

Or should I just run it through the 1040STf I have?

Also, the SST and MegaTalk came out, correct? Where those just Mega ST
compatible boards or is the spec the same as the card input in the STe
(I suspect they are different, but thought I might ask)

Sorry to bother y'all with this, but it is bugging me A LOT and I want
make sure I can run it. Yes, I have a PowerMac sitting right next to
the Mega, but old habits die hard! :-)

Nice idea, but SoundBlasters (even the Live! 1024) have pretty noisy
audio, on par with a stock Falcon. Another serious consideration would
be Rodolphe Czuba's Deesse PCI card, which has a 24-bit 96KHz capable
stereo analogue I/O combined with DSP56301 at 100MHz, both derived from
the Phenix 060 (RIP), and giving the potential for Falcon compatibility
due to the DSP core.

967. Re: Dead SCSI on a TT

Newsgroup: comp.sys.atari.st
Date: 2000-07-26 00:00:00 UTC
From: leaver@netinfo.com.au
Message-ID: <W_pf5.16$x4.6456@news0.optus.net.au>
Source record: 59330

Re SCSI chains - I have both a TT and MSTe. I did not mean to imply that I have ever connected more than one drive to the original Atari MSTe ASCI/SCSI adaptor. All that I said was that that adaptor worked quite happily for quite some years with one drive at a time, but all drives so connected were terminated.

Re auto-termination - I have two self-contained drives, a Syquest ezFlyer and a Castlemaine Orb both of which turn their own termination on and off depending upon whether or not a further device is plugged into their out ports.

Re active versus passive termination - At one time my SCSI devices on the TT were Quantum Fireball SE (internal) and ezFlyer, Sony CD-rom and Seagate ST-157N, the order largely determined by the plugs and cables that I had. The chief purpose of the Seagate, which was the original drive from my MSTe, was to hold HD-Driver. When I relied on the Seagate's resistors to terminate the chain, I would get strange errors when writing to the ezFlyer. Removing the Seagate's terminators and using an active terminator in the second socket of the box that it is in cured the problem.

This was the only time that I have tried a drive with plug-in resistors at the end of a chain with more than one drive, so my experience with that is very limited.

As an aside, I have experienced two other problems that produced symptoms that appeared to incriminate termination, but did not. First, the TT's psu was delivering too high a voltage, the first sympton of which was disk-write errors. Second, I had a very strange problem with HD-Driver 7.71 and ExtenDOS, which HD-Driver 7.80 cured. Small copies (only a few files) from CD-rom to disk were fine, but big copies would be horribly corrupted.

Not going to reprint all that, but, 2 things of note

1, HP printers are notorios for dying, they commonly grind and bang which is a simple lubrication problem. Here in Australia HP will NOT release parts for HP8XX printers, so when warranty runs out HP will ask you kindley for your credit card number. I fix HP's on a regular basis (at least 2 a week).

2, I have been using an Epson Stylus Colour 400 for around 3 Years, with no drama's at all. I do know that the 600, and 800's are also compatible and have heard of the stylus X40's being used with success on the Atari.

I have compiled a disk of commonly used and compatible drivers for most of the popular Atari programs of old and New. If anyone wants acopy for the FTP site or web page let me know.

I remember reading a post that mentioned removing R49 instead of hacking up the Atari VGA Adapter.

Has anyone done this? Do I just remove R49 and that is it or do I have to do something else like add a pull up etc.???

Do I need to do the video mod if I use the Atari VGA adapter or if I don't use a multisync monitor? The way the instructions read it almost sounds like I don't have to do the mod if I use a multisync monitor. Can anyone please answer from experience?

I'm currently using a Mag DX17F.

Anyone know where I can get the low profile Fast RAM SIMM from in the US? I read in this group it is needed if used in original case or the keyboard hits it.

Thanks,

Brian

Hi

An excellent reference book for info, there are others, is 'The Concise
Atari ST 68000 Programmers Reference Guide by K.D.Peel' published by
Glentop. ISBN 1-85181-172-9

It also includes a circuit diagram (schematic) of a cartridge.

It also includes, like the Atari's technical ref. notes, the WRONG magic
numbers!!

If you have any queries etc. drop me a line and I'll do my best to help
out:)

From: cvillard@club-internet.fr
Message-ID: <8llslvgvv2@front4.grolier.fr>
Source record: 59334

Well with some tracks i obtain files on my hd full of silences and bad interrupted sounds.
But, when i want to read the track with the same cdburner (a scsi yamaha 4416s), there's no prob.
So, as extraction is running at high speed, i suppose that some tracks, not enough good, don't bear high speed (my cdburner produces strange noises during the process)

What can I do ?

I have to precise that the prob is completely independant of prog i use.

972. Spectre GCR and a Mega STe

Hello,

I have a question. Way back when, I used a Spectre GCR. When I upgraded to a Mega STe, I had a number of problems accessing the floppies in Mac mode. I thought, perhaps, it was my machine.

I need to know - is/was there a problem with floppy access on Mega STes? Does it have something to do with the Ajax controller? Does the 1.44 floppy do it wrong?

Thanks

-Marlin

What games? I've only tried the recent Doom-ports, and they work a lot
better on my AB/Eclipse than on any 030 I've seen... Also, some other
Falcon-games I used to have worked, while most ST-games doesn't work. This
is expected, most ST-games doesn't work on a standard Falcon either,
unless you run Backwards (or something similar) which AFAIK does not work
on the AB (to be honest I haven't even tried it myself. I have a
Playstation and a big TV.).

> program that needs a 030 etc. I'm not at all envious of anybody's AB; not to

Which programs needs a 030?? Some utilities that needs the MMU does (e.g.
Outside and 030-MiNT), but these doesn't work on a CT2 either.

> mention that at least in Germany the AB had the double price of a CT. If that's
> different at your country, lucky you.

It's not quite as expensive, but my AB did indeed cost about 50% more than
a CT2B. However, this was in 1997, when the CT2 didn't even exist.

Maybe a bootable floppy disk could help here, which sets up the MMU
properly. As this is done before TOS tries to boot from hard disk, it
could be a way to solve the problem.

Ciao

Thomas

Hello All,

Have a simple question. Sting 1.15 works fine, supports telnet and FTP, over a PPP connect which is smooth but slow. Cab 2.7 works, but does not interface with Sting, and CAB errors out. I found a CAB OVL file, version 1.047, and a CAB CFG file from an earlier version, put those in CAB's modules folder, and thought that would work.

What did I miss?

Source record: 59343

"David Leaver" <leaver@netinfo.com.au> wrote in message
news:W_pf5.16$x4.6456@news0.optus.net.au...
| Re SCSI chains - I have both a TT and MSTe. I did not mean to imply
| that I have ever connected more than one drive to the original Atari
| MSTe ASCI/SCSI adaptor. All that I said was that that adaptor worked
| quite happily for quite some years with one drive at a time, but all
| drives so connected were terminated.
|
| Re auto-termination - I have two self-contained drives, a Syquest
| ezFlyer and a Castlewood Orb both of which turn their own termination
| on and off depending upon whether or not a further device is plugged
| into their out ports.

|| You would have a tough time if you tried to use some of the
|| auto-terminating drives, because they insist that you terminate
|| correctly.

Aha, now I understand what you meant by that. If placed at the end
the drive would automatically terminate, which in the case of the MSTe
you would not want.
However since that computer according to you does not support external
devices (because it does not support a bus) that is an academic situation.

|
| Re active versus passive termination - At one time my SCSI devices on
| the TT were Quantum Fireball SE (internal) and ezFlyer, Sony CD-rom and
| Seagate ST-157N, the order largely determined by the plugs and cables
| that I had. The chief purpose of the Seagate, which was the original
| drive from my MSTe, was to hold HD-Driver. When I relied on the
| Seagate's resistors to terminate the chain, I would get strange errors
| when writing to the ezFlyer. Removing the Seagate's terminators and
| using an active terminator in the second socket of the box that it is
| in cured the problem.
|
| This was the only time that I have tried a drive with plug-in
| resistors at the end of a chain with more than one drive, so my
| experience with that is very limited.
|
| As an aside, I have experienced two other problems that produced
| symptoms that appeared to incriminate termination, but did not. First,
| the TT's psu was delivering too high a voltage, the first sympton of
| which was disk-write errors. Second, I had a very strange problem with
| HD-Driver 7.71 and ExtenDOS, which HD-Driver 7.80 cured. Small copies
| (only a few files) from CD-rom to disk were fine, but big copies would
| be horribly corrupted.

Source record: 59345

FamilyNet HQ: Telnet:\\www.family-bbs.net

Alright, this has been most fun, and I have to say that my hybrid Atari
(with the MacOS and Magic) is a wonderful combination. I would love to meet up
with and hear from other MagicMac users in the future.

Got a text editor working (Edith), and strangely, the internet connection
was the of the early things that I got working (Stik2/Cab 2.7). Then I spent
a bit trying to get a decent term program working. Strangely the first real
successful one I managed to get to work, at least as good as it ever worked,
was the alpha version of ST-Ripterm. :)

Freeze Dried Term lives up to it's name under MagicMac, and FREEZES hard.
But it tries oh so gallantly to correct the errors up to the point before it
just outright dies and takes the Mac and everything down in a blaze of colors.
Reminded me of when my Atari 800 locks up.. the colors!! Hehehe...

Got Connect97 (thanks for the tip on the URL!) and learned that 68040
machines don't have the FPU ability and some programs need to be treated with a
"FPUPATCH.TOS" file found in the MagicMac "Magic" folder. After that was done,
worked like a champ. Nicely made program.
Got all things configured, all was great. Saved the options.

Went to load it later, and got an error "Cannot find Conn0.net" and then
it tries to load even further, and then locks up the system pretty badly.

If I don't save the options, it doesn't crash.

any suggestions?

Doctor Clu

I don't know how you tell whether a font has support for ISO 8859-2.
Microsoft have made available a number of TrueType fonts which seem
to have quite a range of characters. They may include the ones you
need. The URL is:

http://microsoft.com/typography/fontpack/default.htm

They come packed in a peecee executable form and have to be copied
from the font folder once they have been installed. They work fine
under Atari Papyrus.

I can't help with your quest to find a way to change the SCSI id
of your TT, but why couldn't you set up a TCP/IP stack? That
won't allow printer sharing, but file sharing would be easy
enough (although admittedly at 115K).

Well, send me a Deesse, and I'll see what I can do :)

GSXB and the PCI64 driver is now very close to being beta-released, as I think it is working very good. I've tested GemJing and Aniplay which works flawlessly. I've tested SAM's Configuration Accessory, which also works very well, both recording and playback, altho not tested SAM itself yet. Also tested a program called Digit II and Sondigit, which seems to work. Also a test program called voice demo works. I've been working on a Mixer program for GSXB too, which is coming together nicely.

The only reason I would prefer a Milan over a PC is that I dont have to run
any other OS besides TOS, that would sell itself:-)

| Did any of the drives have non-SCSI-compliant 25-pin connectors? If yes,
| then using active termination may lead to better results.

How so?

|
| SCSI-2 specifies active termination for FAST-10 (and faster) interfaces.

Please provide a reference because I could not find that.

SCSI-2 recommends active termination as 'termination alternative 2',
(passive) termination 'termination alternative 1' is the same as for SCSI 1
and allowed.
SCSI-3 does not mention passive or active termination other than that a
resistor divider networks (or passive terminator to you and me) shall not be
used.

995. SCSI connection between MAC G3 and Atari TT

Newsgroup: comp.sys.atari.st
Date: 2000-07-27 00:00:00 UTC
From: Steven Kaleita <sak01@chorus.net>
Message-ID: <39804D50.19EA7E08@chorus.net>
Source record: 59273

I Have failed in finding an easy way to Network my TT with my Mac G3.

But all my external Atari SCSI devices work like a charm when I plug them into my Mac G3/Magicmac.

Hd Driver has an option of setting SCSI arbitration, and with that option; If I could change the SCSI ID of my TT, then I should be able to daisy chain my Atari System to the MAC SCSI port and gain access to my TT's internal SCSI drive, along with the external devices.

Does anyone know where to look for the dip switches inside the TT that change the Scsi ID of the TT?

I need to change it to an ID that's different then My Mac.

Thanks in advance,

SAK :)

They should know since a long time now that a correct MMU setup would solve
many problems. If they were interested in fixing it, it would be easy to
incorporate that into the (already patched) Hades TOS. A boot disk is only a
band-aid for someone who does not want to patch the TOS himself.

>How so?

Because an active terminator has a lower termination impedance which matches
most cables better (usually 110 ohms compared to 132 ohms of a passive one),
and it is more robust against low voltages and noise on the TERMPWR line.

>SCSI-2 recommends active termination as 'termination alternative 2',
>(passive) termination 'termination alternative 1' is the same as for SCSI 1
>and allowed.

That is true for the old SCSI-2 draft. IMHO, the final standard for FAST-10
not only recommends but mandates active termination.

>SCSI-3 does not mention passive or active termination other than that a
>resistor divider networks (or passive terminator to you and me) shall not be

Right.

When you talk about a "drive", I usually think about an internal mechanism
with a single connector.

>We are talking about ATARI computers, aren't we? The last time I
>looked at my TT the SCSI port was a 25-pin D Plug. So were the ports
>on the ezFlyer. Most external SCSI drives were intended for the Apple,
>which started the 25-pin SCSI idea.

Which does not remove the problems that this deviation from the standard
creates. There is a reason why later SCSI standards did *not* pick up this
connector.

25-pin connectors work fine as long as you are only using asynchronous
devices, which is why it worked fine with Apple, TT etc. - however, when you
try to attach modern devices which are capable of faster transfers (and thus
are equipped with the required bus drivers), you get into trouble.

The SCSI standard specifies an environment which will work with enough
margins if all parts comply to the standard. The more you ignore the
standard, the lower your margins get, so you can't complain if it works only
sometimes or in some environments/combinations.

>However, we are drifting away from the point. This thread started with

>schemes as advice to others because they will almost certainly only
>mislead the person seeking assistance.

Right - we seem to agree.

The problem with such expeciences is that if you have a
non-standard-complying setup, the results may vary from machine to machine,

so the advice does not necessarily help. If "It works for me" that is fine, but it does not guarantee or even indicate that it will work on another machine. Resorting to experimentation is fine if the "correct" way does not work due to some circumstances, but advising the results of such experiments as a general fix is not good.

1001. My CT2B install woes

Newsgroup: comp.sys.atari.st
Date: 2000-07-27 00:00:00 UTC
From: Brian Hutchinson <brian.hutchinson@ericsson.com>
Message-ID: <39806F3B.8498A4BB@ericsson.com>
Source record: 59279

Greetings,

Finished my install using the latest fitting.txt instructions. I removed the CPU with a hot air surface mount chip extractor. Cleaned up all the pads real nice (kept the original chip too! .... at this point looks like I might need it!)

I noticed these instructions are a little different from the original. Most obvious is wires 3 and 13 are missing from the instructions. I can see why wire 13 is not used. The wire coming from the 50MHz clock going to pin 14 of the Videl takes care of the old instructions use of pin 13. I'm not sure why pin 3 isn't used anymore. Anyone know?

The only other thing I'm not sure on is the Video Adapter Mod. Robert S. mentioned in an old post that removing R49 was same as hacking the adapter. I removed R49.

I used Kingston 32M 60ns EDO. It is a 8x32. The part number is KVR8X32EDO/32-R.
It has 16 chips on it (8 per side) I hope this is the right type.

When I power up in normal mode I get nothing. The monitor does not lock onto a signal. I hear the HD spin up but do not observe any access. If I power up in turbo mode I get a light blue screen but nothing else. I took the SIMM out and powered up without it and got the same results. Not sure if it is because it does not like the SIMM or what.

I'd appreciate it if anyone who has done their own install could help me trouble shoot what the problem is. I have access to scopes etc. so shouldn't be a problem. I'm a software engineer so I can't design hardware but if you tell me there should be a certain freq. coming out of a pin I know how to look at it etc.

Thanks,

Brian

This is extremely old software. I used to sell it as an Atari dealer in the 80's. I would be very surprised if Royal Software is still around. Most likely only one version was issued, as Royal was not a major player in the Atari software arena. Your friend should really consider moving up to something more modern and supported like Texel.

Wish I could help..... However,
it will be interesting to read if you receive all the help that is said to be available for the CT2 here. There were a lot of post about how helpful Centek was, and praise from other users here, but none of my questions were ever answered. Mine has been sold, so that problem is solved. The longest statement that Centek has made in this newsgroup concering the CT2 was in defence of personal character, nothing about their hardware.

There are undoubtedly numerious "fixes" to get the CT2 working properly. Would it be to hard for the manufacture to document all the "tricks" for a sucsessful installation performed by technically inclined user? The documents provided with my unit surely didn't cover removing the CPU:)

It's one of those "shudda been there" things, but the support that Doug Little provided when the Afterburner was made available was phenomenal. Sorry, I just don't see it so in this case.

Good luck with the installation. Once up and running properly, it was probably one of the best upgrades ever offered for the Falcon (other than the Afterburner:)

> up an external 720 and just run floppies through that?

If I remember correctly, the problem was in the floppy controller chip, not the drive, but I could be wrong. The only way I was able to keep the TT Spectre compatible, and you can probably do this in the Mega STE if your floppy controller is socketed, is to replace the AJAX chip with the original ST's Western Digital chip, and possibly change the floppy mechanism to a 720k drive. I also changed dip switch 7 (?) to let TOS know that 1.44 support is not installed.
>
> Or should I just run it through the 1040STf I have?

A lot easier if you can stand 8MHz, and can get a 4MB RAM upgrade for it.
>
> Also, the SST and MegaTalk came out, correct? Where those just Mega ST
> compatible boards or is the spec the same as the card input in the STe
> (I suspect they are different, but thought I might ask)

Yes, both products were released. The high specs on the MegaTalk serial chips were incredible for it's time, and still faster than what's normally used today. As for the Mega expansion bus, I don't know if they are spec'd the same or not. Martin-Eric Racine might know since I suspect the Mega STE is more closely related to the TT than the ST.
>

Sure, why not. I've long decided that Atari is a legitimate hobby even if we are falling behind the power curve. If people can have a Porsche in the driveway and restore a 55 Chevy, we can have the latest computers and still tinker with Atari.

This of course remains highly in the theoretical realm for most of us since most Falcon DSP software is badly written and won't recognize the DSP's new location. If authors are still around, the code can be patched to recognize it.

I'd check with Rodolphe to see if this is authorized. You might try a
different video adaptor. I use the Chromagic because it is switchable from
VGA to RGB.

The Fast RAM SIMM is irrelevant to normal mode operation. You can remove it
or leave it in, as Normal mode only uses ST RAM. You should contact
Rodolphe directly, as he was quite helpful with all my Centurbo questions.

I have used GCR on a MSTe with TOS2.6 and 1.44 floppy and it _did_ work
well!

The trick was to access the drive with a 1.44 floppy inserted just
before starting the emulator. Doing that I could use 1.44 floppies in
Mac mode too!

Don't know about the cable lenght problems, though. Never had any
myself.

There are no scientific measurements on this list. My experience differs.
I've regularly tested Yamaha drives from the CDR102, 4260, 4416, 6416
right up to the 8424 and they all extract audio no problems. My hard disk
is *full* of audio files, all extracted with Yamaha drives. My tests are
quite thorough because I often get the chance to test a whole batch of
drives of a particular model. I also know many professional musicians
using Yamaha drives, and audio extraction is definitely not a problem
for them. If anything, I hear more of the PSU fuse going in Yamaha's
SCSI cases (of the external drive kits).

At first a reluctant convert to Papyrus, I fell head-over-heels
for it when I received an emailed MS Word Doc and found that Papyrus
could actually convert, read and print it. WOW! I said! Nothing else
can do that! Previously I had to spend ages with Protext or another
Editor removing the MS cr*p.

So, how do I pay my subscription and register for it? I can't find any
info in the docs supplied in the Demo (info must be there somewhere?).

Help, please,
Charles.

PS: I'm watching the ITN News. I offer my German readers my
prayers and symathies on the tragic Concorde disaster.

about Yamaha CDR and audio extraction....

I have Yamaha CDR-400c(rev 1.0q), and works veeeerry bad comparing
to my CDROM Teac CD532S (rev 3.0A).

I know Yamaha works, but not once audio file was same
if I copied a song twice (or 4-5 times) from Yamaha.

But TEAC works *GREAT* even if I copy pirate CD which cannot even play
in CDROM Pioneer (old one, 4x), files are same.

From: Brian Hutchinson <bthutch@earthlink.net>
Message-ID: <398107C1.5537E537@earthlink.net>
Source record: 59202

I wanted a AB040 but at the time I first looked at them they were over $800 US. Now they can't be found so CT2B was my next choice. I hope I can get this thing to work. If someone who knows how to trouble shoot this thing can tell me what to look for I can handle it, I just don't know what to look at at this point.

I've taken an ohm meter and rang every connection. I know I made all of the connections good and that I don't have any shorts around ICs, ribbon cable header etc. Time to start looking at signals and states, I just don't know what they should be.

I used the labs at work and did everything under a microscope. Install went very well it just doesn't work now! Helps having the right tools.

Phantomm did his own install and he said something about changing the resistor for the DMA to 100 ohm. I think the one from Centek is around 70 ohm (pin 14 on U20 AJAX). Anyone know what this signal is supposed to look like .... amplitude ... timing peak to peak etc.? Could this be one of the problems?

I need some ideas. I've checked all of the obvious stuff. A hardware engineer at work looked over my job so I would have an independent check and all was good. I need to know how to tweak things now.

Thanks,

Brian

1020. NEWSie 0.96 Upgrade 1

Newsgroup: comp.sys.atari.st
Date: 2000-07-28 00:00:00 UTC
From: rojewski@primenet.com
Message-ID: <8lqpmuhlm1@nnrp03.primenet.com>
Source record: 59203

NEWSie 0.961 is available at:
http://www.primenet.com/~rojewski/beta961.zip (112731 bytes)
-or-
http://www.primenet.com/~rojewski/newsie.html

I have produced some changes in response to input from users.

What's New in NEWSie 0.961

This is a brief overview of new features and changes in this release.
Note this is a PRG update only. No other files are changed. You will need
NEWSie 0.96 installed to use this upgrade.

Support For DHST (Document HiSTory) in Start-Me-Up 8.0 and above
When a new article, mail, or browser file (html, text, etc.) is opened, a
message is sent to the DHST server to the fact. Later, if Start-Me-Up 8.0
or above has the /document line enabled, it can cause NEWSie to re-display
these files. Note: The files are display only, and are not usable for news
followup or email reply. Maybe in a future release. :)

Bug Fixes
Don't overlay FTP directory unless requested. Part of 'Save Last Directory'
Deleting FTP server looses correct directory. Corrected.
Mailbox display was not updated by double-click on mail entry. (Cosmetic)
Prevent problems with news References line being word wrapped by editors.

Enjoy,
John

About the only thing that comes to mind is Rainbow Multimedia when
thinking about incompatible 040 apps. Rainbow won't run from fast ram
either on an 030 based machine. Demos are cool looking, but just
remind me that I am a very, very poor coder:)

AIRC, somewhere burried in the AB docs or the AB mailing list archive,
Doug discussed what Peter and he found when working with the DMA
signal.

I will attribute the misunderstanding to a language barrier.
The way your post sounded was like making fun of the AB to me:)
I'm a Falcon nut all the way, doesn't matter what is in it. I hate to
see "upgrade wars" however.

I never read (or wrote) anything against the AB in this thread
(or elsewhere). But I read many (mostly very vague) things
against CT2, which I'm very happy with, even as I know that AB
is faster. But I think you're right that it can lead to
misunderstandings that people like me are writing in english
as if that were their native language and they would know what
they are writing ;-) All the more reason to stay cool (or at least
try too, I also don't succeed always, as you surely read) if
one's not 100% sure.

There are no DIP switches at all. Please refer to the HDDRIVER manual on
how to change the TT's SCSI ID.

Ok, I switched to the TOS option under "compatibility"
I use "SPLIT" to partition to 4 this time.
I exit HDDriver. (which for now is booting from floppy A:)
I create my desktop icons. "Save desktop"
I press reset. The program hangs with floppy A: drive light on. Why?
I power everything down.
reboot. Drive letters CDEFGHI appear. The 4th partition is not accessible.
I take a look under "partition type"
$0b
BGM
BGM
BGM

Shouldn't the $0b be changed to BGM?

But if I change and proceed, I get a warning that vital information
will be erased from the CORE. (SCSI harddrive)
So what do I do in order to access all of the partitions?

Please ensure that *nothing* is visible in the partition type field
before saying OK in order to create the partitions. Most likely this was
not the case since you only have three valid TOS compatible partitions.
The partition you cannot access is actually the first, not the fourth.

Still, the driver for the SB sounds nice. I would not mind running Falcon software on my Hades, but right now my concern is just better sound. I am not thrilled with the little Yamaha soundchip. If the driver for the other card comes out, then I just may give it a try.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs for NEW Atari stuff!!

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out
into Atari Jaguar Hardware & Games. So check out what's new on my Web
Site. I have 8 different Catalogs, & my SoftWare Catalogs are largest.
They have the biggest Byte Count. Boy! You should see my inventory! I
have Libraries of Books and Reference Material, TruckLoads of HardWare
and Crates and Crates of Software for the Classic Atari 8 Bit, Atari 64
Bit Jaguar Game Machine and the Atari ST and Newer Computer Line!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want to order and E-Mail me the rest of what you do want to order! To
expedite things, include your complete Mailing address so I can figure
Shipping/Postage and Handling. I'll be back after the weekend.

And remember, if you can't come see me today, come see me tomorrow! :-)

atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to bensmith@teleport.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

And I guess a PC would be more equivalent to a mini-van, wouldn't it. ;)

Was it John Kolak that mentioned being able to use the 1.44 disks in the
Macintosh Spectre mode? That is incredible.

So did it format as a 800K or 1.44K disks?

Hi !

It seems that Pure Software bought the license for the standard C librairies
from Borland.
So you can see Borland on Turbo C for ATARI (note that Turbo C was also the
name of one of the first Borland C compiler on PC)
After, Pure Software decided to call it "Pure C", but the standard
librairies are licensed by Borland.

See you, Jean

Well.

Feurio has it's test cases, so does SPIN (DDSTEST). Both report that
the drive fails at exact audio grabbing.

If your experience is different, then you probably use grabbing
software with jitter correction or something similar.

I do remember now that Dave Small was asking us to shield floppy ribbon cables as far back as the Mega ST days. I did it to my TT too, but I don't remember if it was necessary, or just a precaution. I wrapped the cable in aluminum foil, and then wrapped it in plastic to prevent accidental shorting inside the computer. I do remember it solved the problem on the original Mega ST.

The obvious thing to do would be to replace the resistor you removed from the
back of the motherboard. You don't need to perform the video mod if you aren't
using the official Atari video adaptor if I understand the situation right.

I'd recommend emailing Rodolphe with your queries, also there's some info on
Robert Schaffner's Doitf030 pages (you'll need a key to unpack the archives).

For me, hitting ESC when there was a long delay in the first NG listed,
in 0.94 meant later reselecting the first ng and then Read for offline.
In 0.96 it appears that, after the same delay and hitting ESC, Newsie
gets the other NGs then returns to the first and gets the remaining
posts (meanwhile I download emails and reply).

>
>Sorry, no ideas - it does the same thing with me (on a Falcon). I'm staying with
>v1.15.

I got 1.26 up and running with no difficulty. May I ask, in helpful
mode, I hope:

Did you remove *every* item of your older STING *and Dialer* to a separate
place (eg, folder STING.OLD)?

After installing 1.26, did you compare and edit the new Dial.SCR and
Default.CFG with your 'old' ones?

Did you remember to re-arrange the order of your AUTO folder so Sting.prg
is after HSModem (Drvin.prg, etc)?

And did you copy back your Sting.Inf, Dial.Inf and Local.Fee files to
the new version?

(Have I missed anything out?)

Try again, guys: it's worth it.
Charles.

From what I've seen, the Milan040 "Atari ST" computer is a serious hodge-podge of PC motherboard design, mixed with a 68040 processor and a mutant TOS. It may look like it's an Atari onscreen, but I think what they've done is taken the corpse of the Falcon030 and thrust it into the vile den of PCdom (slots galore with all the compatibility issues (is this or that card supported by MutanTOS?) and plain motherboard ugliness and a tower case. Not how I envisioned my future Atari to look/act at all.

Can't remember now!

>After installing 1.26, did you compare and edit the new Dial.SCR and
>Default.CFG with your 'old' ones?

Again, can't remember. But that's the sort of place where I'd give
up. I haven't got a clue what all the variables and configs are - I
got my current scripts and things from others that worked, so if they
were different what would I do? If the new Sting won't work with the
old files then I wouldn't know what to do to get them working.

Is it too much to ask for a piece of software to work with previous
versions of your settings?

>And did you copy back your Sting.Inf, Dial.Inf and Local.Fee files to
>the new version?

And that's another point! Presumably you're implying that it's OK to
copy these files from the old version, but not DIAL.SCR and
DEFAULT.CFG. How exactly are we supposed to know what's OK to copy
and what isn't??

Anyway, with those hints, I might try again! Thanks.

Maybe you _should_ be smoking pot if you think that your '030 has anywhere near the processing power of any Pentium processor.

Try playing some MP3's sometime... Incidentally, I can play MP3's just fine on my old 486DX50... using a DOS based MP3 player. No skipping, full 16bit stereo playback at the highest rates.

Now you try on your '030 and enlighten us all as to how well your '030 performed...

>
Hello.
I bought an Epson Stylus Color 460 to work with my Falcon with NVDI 5. The printer works but very, very ,very slow. It takes a couple of minuts to print a text page (no pictures) with TTF fonts and more than 10 minuts to print a doc with two pictures. I use the NVDI Epson 400 driver. I thought that was a Falcon problem but reading your messages talking about no compatibility between Epson printers i think this is the problem.
To print the single text doc i select 360 dpi and black&white option in the NVDI printer CPX module. To print the doc with the pictures i select 360 dpi and full color options.
Can anybody help me?
Thank you
David Galvez

I tried this last night to no avail. I must have been doing something wrong as everything works independent of each other. When I try to book from a floppy in Mac Mode it simply will not work. Sometimes it sees it as a system disk and then eventually craps out or refuses to see it as a system disk and craps out. (no lock up or anything, it just flashes "A" or "B" depending on where I try.)

If the person who did this could tell me what EXACT procedure should I follow, I would be grateful1

That's true. I just don't agree with agree with your definition of a
"decent OS" ;-) A fast OS is nice, but it's more important that it's
usable.

It's a pity the manual is that vague. Some how I'm suppose to magically know the TT has T-style chain, and I just find this out only a few days ago on this thread. I don't see where a generic scsi faq is helpful if you don't know that you have a T-style chain to begin with or how to identify one. I still say some simple block diagrams specific to Atari models would help people.

> It is puzzling that Atari Corp would not say anything in the TT owners

> about TT SCSI port termination?

I've had 3 devices hanging out there for nearly 8 years now and those resister packs you mention have been intact. Also the internal drive was shipped to me with it's term missing. So by all standards it should of failed misserably. I managed to find an old drive that was identical to mine and have put the term in place, I also pulled the packs from the motherboard. It all works just as it did before. I'm baffled. ;-)

> None of my Macs require fiddling with internal terminators to add an
> external SCSI drive, and it seems like a very similar situation on both
> the TT and the Macintosh.

So after 8 years of improper termination, it is now correctly terminated I hope. hehe

1080. [HELP] php

Newsgroup: comp.sys.atari.st
Date: 2000-07-30 00:00:00 UTC
From: bruno.aubin@free.fr
Message-ID: <wOUg5.802$Tl2.3208340@nnrp3.proxad.net>
Source record: 59163

N'ayant pas trouv&#65533; de forum sur php et ayant, depuis 1 semaine, un probl&#65533;me insoluble sur php, je me suis dit que, peut-&#65533;tre, certains "potes" du fcsa (peut-&#65533;tre les linuxiens ?) pourraient m'aider. A d&#65533;faut de r&#65533;ponse, au moins m'envoyer sur une mail list, ou un autre forum ou l'on parle de php EN FRANCAIS (je ne suis pas anglophobe, mais &#65533;a me prend la t&#65533;te que partout o&#65533; l'on a besoin de quelque chose d'important, il faille parler la langue de jexpire).

Mon probl&#65533;me est le suivant. Je suis h&#65533;berg&#65533; chez free depuis peu, et j'utilise le php3 (c'est ce qu'ils ont). Lorsque j'ex&#65533;cute un certain script contenant le code suivant :

```
....
$liste_bro=fopen("browsers","r+");
$i=0;
fseek($liste_bro,$i);
while ($ligne=fgets($liste_bro,78)
{
$buf=unpack("A10type/A64browser/lint",$ligne); //ligne 45
...
$i=$1+1;
fseek($liste_bro,78*$i);
}
```

L'interpr&#65533;teur php+Apache sur free me renvoient le message suivant :
"pack typel: not enought input, need 4 have 1 in your script on line 45"

Alors j'ai fait diff&#65533;rents essais. Cela ne vient pas du fichier, ni de la longueur lue, ni de fseek (qui marche impeccablement ici, contrairement au seek de perl sur Magic On Line), mais bien de quelque chose qui doit manquer dans "A10type/A64browser/lint" et plus particuli&#65533;rement dans le type "l". Les autres types (A10 et A64 marchent, j'ai test&#65533; ce format sans le type l).

Alors si vous voulez continuer &#65533; voir &#65533;voluer mon site Internet, une aide pour ce probl&#65533;me (une VRAI r&#65533;ponse de quelqu'un connaissant la programmation php SVP) me serait vraiment pr&#65533;cieuse. Autrement pour les autres scripts, je pense me mettre au SGBDR Oracle 7 et 8, dont la version 8 est aussi Orient&#65533;e Objet.

Je signale &#65533; tous les programmeurs que, tout comme perl, php est aussi orient&#65533; objet.

Voil&#65533;. J'esp&#65533;re avoir une r&#65533;ponse tr&#65533;s prochainement...

axolotl (Bruno AUBIN)

1081. [WEB] New Aniplayer 2000 v 2.12

Newsgroup: comp.sys.atari.st
Date: 2000-07-30 00:00:00 UTC
From: didier.mequignon@REMOVE.wanadoo.fr
Message-ID: <8m18k9dur1@wanadoo.fr>
Source record: 59164

Hi,

The latest version of Aniplayer (2.12) is on my site:
MPEG movies with sound are played. On Falcon DSP is used for sound,
so it's better to have a CT2 or an AB040. DSP is used for pictures
if 'shut-off sound' is checked. You can save sound in AVR/WAV/AIF/MP2
or movie in AVI/MOV (a good idea for a slow machine). Another
possibility is to save sound into a WAV in the same directory of the
MPEG file and after when the MPEG is started again, Aniplay replaces
the sound played (compressed MP2) of the MPEG by the WAV file not
compressed. The better solution for MPEG seems a Milan 060 with Deesse
card or a Falcon 030 with a CT60 (http://www.czuba-tech.com/).
Without DSP, a 68060 is a minimum...

Regards,

Didier.

1082. Re: My CT2B install woes

Newsgroup: comp.sys.atari.st
Date: 2000-07-30 00:00:00 UTC
From: phantomm@eastky.net
Message-ID: <8m041qnc1@nd.eastky.net>
Source record: 59165

On 27 Jul 2000 13:33:09 , Brian Hutchinson wrote:

Just wanted to add my 2 cents on the CT2B.

Yes I did it myself with excellent results but I did have one or two problems
at first which I fixed by trial and error.

I did have the Toggle switch wired up wrong, but was easy to fix.

I did not do the VGA adapter modification and I do use the Stock Atari
VGA adapter with a 17' SVGA monitor with no problems at all.
I get 800x608 in True Color Mode which I use all of the time because
I'm much into Graphics and Video. However I can easily go way above
1280x960 in 256 colors if I want. And it is Clear as can be. So I am
not sure why the modification is suggested??

No one has gave me a clear answer as to what I would gain by doing this
modification, at least I've not seen it. If you know then please e-mail me.

The main problem I had was with the Falcon SCSI system in Turbo Mode.
My SCSI devices were not being seen. I fixed this by replacing Centek's
resistor on the SDMA with a 100 ohm resistor and have had no problems with the
SCSI devices at all. Now I'm not sure how this would work on other
CT2B Falcons. But it was needed for mine to work properly.
The timing of the Falcons SCSI port signals need to be right or you will
run into problems with SCSI devices. My CT2B needed the 100 ohm resistor
to get the timing of the SCSI signals were they should be.
I have 4 SCSI devices, 2 hard drives, 1 CDR and 1 CDROM.

If you are having problems with your SCSI devices then try replacing
Centeks resistor on the SDMA with a 100 ohm. Actually it may not even
need to be that high of a value. This should be very simple to do.

Also want to add here that before I fixed the SCSI problem. I had to unplug
my SCSI cable from the Falcon before I could use the CT2B. The Falcon would
freeze when trying to access the SCSI devices on bootup until the resisor was
replaced.

Now I use CECILE in the Flash (latest version) for Turbo Mode and HD Driver for standard
Falcon mode. It is as stable as a stock Falcon in Turbo Mode and standard
mode. No problems with anything except for trying to run games or some
demos in Turbo mode. Have noticed a slight problem when using Video
Master Falcon in Turbo mode, but I think there maybe a way to fix it.
Wouldn't trade it for the latest PC on the market.

phantomm@eastky.net

Hi,

I am using the grey Atari VGA adapter. I have two of them. One goes to a 13 pin round din type connector .... an Atari monitor which I don't have.

The other one I have goes to a SVGA connector and this is the one I am using to hook up to my MAG 17" monitor.

Do I need to do the mod or not? Did I misunderstand something?

Thanks for the reply,

Regards,

Brian

It would be nice if posters of auctioned items would state what they are auctioning instead of just the link. There are users/reader that use a separate program to read articles, and have to exit the program to run a browser. And it would be nice to know whether or not the items are of interest without having to go through a link.

While I'm at it people could list items they have for auction, that are relevant to the newsgroup, and instead of having lots of auction links, why not just have ONE that links to ALL the items they have up for auction!!!!

MP3's aren't necessarily the only judgement of processor
speed. Considering that alot of Intel platform software uses the boards
in your system to help with the processing. If you had a sound card from
1987 I imaging your performance would not be as wonderful as you say it is
now.

The Falcon given it's DSP chip can play back MP3's quite well, and
the DSP in the Falcon is somewhat of a childrens toy compared to what is
on PC sound cards these days.

If you want to compare something more valid, why don't you look at
something like displaying a JPG image. The TT easily compares to a 486 in
this case. If you start talking about actual system feel. Give your PC
windows 3.11 (unless you really want to compare DOS and TOS directly) so
that you are comparing two GUIs. You will see then that an 030 for most
user interaction compares just as nicely as a slow Pentium chip. If not
faster. It wasnt' til the leap to PII that my office PC finally got the
text display etc functioning as quickly as it did on my Atari at home.

Sorry if you don't like the above but I think you are the one who
has been smoking POT.

First, the Milan is not like a Falcon at all - more like a TT, if anything.
You can like or dislike the choice of a standard case and keyboard/mouse,
but it makes sense (because you can't manufacture custom-made
keyboards/mice/cases in such low volumes for a good price, and ST/TT
keyboards are not available anymore).

About plug-in cards: TOS does not need to support them. TOS initializes PCI
cards, and then you need a driver for your cards - just like with any VME
card in a TT, or any falcon extension (NOVA etc.). Having slots just makes
installation of these extensions easier to the end-user, because no
soldering and no modifications to the case are required.

The modifications to TOS are needed to support the new hardware - Atari did
the same with every model. Using an unmodified TOS fixes you to unmodified
hardware (or at least register-level compatibility), which is more expensive
and unflexible, because you can't add new features.

You don't have to like this approach, but it makes sense in terms of
offering a good performance and compatibility for a reasonable cost.

Huh? the standard PC sound card does nothing to help the CPU decode/play
mp3s. The trend in modern low-cost PC cards is to offload even more tasks
(liek waveform synthesis) to the host CPU, since it is "fast enough" and
makes the card a bit cheaper.

All a basic PC soundcard does is take the data from memory and D/A-convert
it - which is about the same that a falcon can do using it's sound DMA
without the DSP.

> The Falcon given it's DSP chip can play back MP3's quite well, and
>the DSP in the Falcon is somewhat of a childrens toy compared to what is
>on PC sound cards these days.

No - there may be DSPs on some cards, but these tend to be fixed-program
ones which are used for 3D-effects or similar, but are not freely
programmable (and are definitely not used by programs like winamp).

> If you want to compare something more valid, why don't you look at
>something like displaying a JPG image. The TT easily compares to a 486 in

I doubt this. Take a Pentium-90 or even a Pentium-60 and some optimized JPEG
routines (like those used on the TT), and the PC will be a lot faster. My
P-133 was even faster on such tasks than the TT when using the TOSwWIN
emulator ...

It was me. After thinking this over I'm not so sure anymore that I
actually managed to use 1.44 floppies with GCR.

I do know for sure that I could not read floppy A in Mac mode unless I
did a read operation in Atari mode just before starting GCR. Maybe I
had a 1.44 normally inserted from startup and had to put in an Atari
formatted 720 disk for reading to make the emulator use Mac 800 disks.

Anyway I was able to use floppy A just fine with GCR after this
operation. This would make sense if GCR has no built in handling of
changing the steprate etc.

!!!!
You should read again the CT2 fitting manual !!!!
It is clearly said :

If you have need to use the external clock AND IF you have an atari moulded
vga adaptor !!!!
It is clear that if you use a 17' multisync (!) monitor, you use the 50 MHz
master clock, NOt the external clock !
SO, the problem of the VGA moulded adaptor is not your problem !!!

I really bored by people that don''t know READ a manual !!
I think I will not write a manual at all, next time !!

AND is not OR !! ok ??!

1098. Loaded TT030@48mhz for sale

Before I put this on ebay I wanted to offer it in this newsgroup first. This TT030 has
4 megs ST-ram & 4megs Fast-ram, a Quantum 540 meg Harddrive loaded with software (most major programs), an AlberTT 800*600*16 VME graphics card, an NEC Cdrom drive CDR25BJ, a Syquest 555 - 44meg removeable drive with 5 cartridges and an Adaptec 1505 Scsi card for your PC. This enabled me to surf
the web on my PC and download and easily move programs to and from my TT and PC. I used programs on both since I have MagicPC and other emulators. There is a VGA monitor also which someone can have if they want it, but it only does 640x480 so it won't work with the AlberTT video card. Includes mouse and keyboard.
pictures of the setup can be seen at:
http://www.pixhost.com/pixj/jtdon/ttplus.jpg shows the setup

http://www.pixhost.com/pixj/jtdon/ttpic2.jpg shows Gemview running at 800x600 showing a couple of .tif images.

http://www.pixhost.com/pixj/jtdon/cyrel.jpg shows a screen shot of cyrel software showing CPU mhz and available memory.

The 800x600 video card makes using spreadsheets and drawing, cad programs much easier to use.

This is a fast, easy to use setup, ship to US only

questions, offers to jtdon@direcpc.com

also available MegaST4 w/ 125 meg HD, color & mono monitors
1040ST w/2.5 meg memory 42 meg HD, color monitor

Since you tricked me into reading this I'll reply by saying
that I often buy Atari items but never thru ebay.
I hate ebay, the prices are often inflated, and stuff is often
labeled rare when it is not. If you intend to auction, at least
say so in the subject line. ;(

You got it. I like how the previous responder completely missed
what I said. I said an 030 was easily comparable to a 486 in jpg
decompression and they went on to say they doubted as a p90 was better
than a TT.

As to the MP3 playback we have at least 1 sound card at work that
has mp3 decompression directly on the board. But I guess since some of us
actually like using our atari hardware, we must not know our asses from
the proverbial hole in the ground.

I suggest this thread move to advocacy. Maybe

Correct. Since the thread started with a comparison of a pentium-class PC
with atari hardware, I missed that it had shifted down to a 486 by now.

> As to the MP3 playback we have at least 1 sound card at work that

Nice - however, that would not be any of the cheap SB16 or compatible
cards (or the PCI versions) which you get with every PC.

Actually, what card exactly is this? it might be interesting for Milan/hades
owners with a 040 CPU.

Go here:

http://www.egroups.com/files/atari-midi/

and look for GEMEXPLOR.ZIP

It is a utility that lets you read Atari Discs! (found out about this
from this newsgrp!) I am pretty sure you can then just transfer the
files to your PC hardrive, however one at a time. Hopefully Cubase will
be able to read it.

The only other alternative is to get a real Atari with Cubase and
convert them to midi files.Just remember to use DOS-formatted 720K
Discs to do the transfer as discs formatted from the Atari desktop will
not work, which might be the problem you are having. On the same link
above there is a Utility for Atari called HCOPY17 which formats a dos
disc on the Atari desktop.

hope this helps.

BTW..if you have an Atari, the Link above is a treasure of Freeware and
Shareware.

1115. [HELP] Installation instructions for PC-Speed

Newsgroup: comp.sys.atari.st
Date: 2000-07-31 00:00:00 UTC
From: french-lines@usa.net
Message-ID: <8m4sliitv1@nnrp1.deja.com>
Source record: 59107

Hi,

Many years ago, I acquired a "PC-Speed" hardware device from SACK Electronic GmbH, which would plug over the 68000 CPU of an ATARI STe, and give access to DOS based programs.

In fact, I never went on to installing the device, (probably because I didn't want to void the ATARI's warranty), and the box laid in the back of a drawer for many years. Finally, I have decided to give it a go. I have all that is necessary (the board, the software) except the installation leaflet which presumably explains the hardware installation procedure (in particular, which way round you should install the board). My board is specifically for STe's (square type CPU).

So, if anyone has experience with this, and has kept the installation leaflet, I would be very grateful if you could send a copy (either scanned leaflet, or just the instructions).

Thanks in advance,

Patrick

>>tower case. Not how I envisioned my future Atari to look/act at all.

Absolute nonsense. None of the Falcon's custom chips are on the Milan.
How do you expect a motherboard to look? Milan only looks plain
because all the integrated functionality that made computers of
yesterday "special" are now on plug-in cards. The days of the
do-it-all one size fits all computer are over.

>First, the Milan is not like a Falcon at all - more like a TT, if anything.

>but it makes sense (because you can't manufacture custom-made
>keyboards/mice/cases in such low volumes for a good price, and ST/TT
>keyboards are not available anymore).

Exactly. Atari users who still have the "Power Without The Price"
idea, and still think the Atari market is so buoyant that it can
still afford to be like the old days... You're dreaming.

Exactly. How many brainwashed PC users think they're getting a bargain
modem, totally unaware that it's a SOFT modem. Eventually, with so
many tasks offloaded to the CPU to make the peripherals look cheaper,
where's the benefit of having a fast CPU in the first place?!

You can calculate a standard deviation by steam in any spreadsheet
that provides a square root.

Assume that the original numbers are in a column eg A
In column B calculate the squares of those in A

Calculate @sum(A) and @sum(B)

Then, calculate

T = @sum(B) - @sum(A)*@sum(A)/@Count(A)

If you regard your list of numbers as encompassing the whole
population, calculate the variance as

V = T/@Count(A)

If you regard your list of numbers as a sample from which you want to
estimate for the whole population, calculate the variance as

V = T/(@Count(A) - 1)

Then

Standard Deviation = @SQRT(V)

I've been experimenting with the Falcon's D2D software and have coume up against a couple of annoyances, the largest being that the .TRK format seems to be atypical. Does anyone have a link to another direct to disk program for the Falcon? I experimented a bit with something called StudioSON and really liked how it could record .WAV files. I did not, however, like how it kept blowing up!

>

Actually I have egg on my face. I went to check on the board
today at work as I couldn't remember. I can remember exactly now
either. I was going to post from work and couldn't get to the news
server. Anyway after checking I discovered that it does MP3 encoding with
hardware, not decoding. I think (possibly wrong as I didn't memorize
it) that it's official name is something like Soundblaster Live MP3
PCI. They run about $100 US. So it's not a $19 card, but it's not that
bad when you start comparing it to 'quality' cards. Not saying it's that
high end either.

Suggestion:

Look around for settings concerning Carrier Detect. Tterm is picking up a wrong
config from somewhere (HSModem or your modem's confing perhaps?), and is using
that to report that its online all the time.

Hi Phantom,

P>So I am not sure why the modification is suggested??

If I'm not mistaken, it's just for the case you had an external clock to your videl, like from a BlowUp or Screenblaster, which have 32Mhz. *This* clock can't be used when having a CT2 and the Atari adapter, but ho wants it anyway when you can have 50Mhz without additional hardware? I sold my BlowUp after having installed the CT2.

Bear in mind that the Falcon030 was designed in 1992 or so.

Take a PC from back then, which was probably a 386 running
Windows 3.11 or DOS. Then, the Falcon shines.

Actually Dan is right - my TT030 would decompress EK Photo CD files in about the same time as a friends 486-66 and was faster than a 486-33. As the original Pentium processor was two 486 processors on a single chip it was faster than the TT, but not as much as one would have expected. For about a year or so overclocked 486's were able to keep pace with the original Pentium.

1131. HELP! re: Teddy Term

Newsgroup: comp.sys.atari.st
Date: 2000-07-31 00:00:00 UTC
From: ag352@chebucto.ns.ca
Message-ID: <8m2ljakvj1@News.Dal.Ca>
Source record: 59189

I used to love that shareware telecomms PRG, TEDDY TERM. I used it for two years. Suddenly, it is as if every copy of it is corrupt.

When I boot TTERM, it thinks I'm already on-line when I haven't even gotten to the dial screen. Go to the dial screen, nothing happens. Moden LED's show that it's at rest and off the hook TR, MR. and HS lit, all others dark, as it should be, yes?

Someone gave me a copy of Flash 1.6 and it doesn't have this problem. But it's restricting my downloads to the ancient Xmodem protocall AFAIK. I liked TEDDY TERM.

my system: 1040STe TOS 1.62 4/540 ICD 16mHz AdSpeed card/Cardinal 9600v42 modem

MEANWHILE, my wife's copy of TEDDY TERM in her Mega STe (TOS2.05. Seagate 42mB HD/Zoom 2400 modem) now says NO DIALTONE.

What is it with that software? is it just set to go off?

I attend 2 different Atari User Groups and nobody has a clue about this, seemingly.

>SO, the problem of the VGA moulded adaptor is not your problem !!!

>I really bored by people that don''t know READ a manual !!
>I think I will not write a manual at all, next time !!

>AND is not OR !! ok ??!

I have read the manual many times which states:

If you have the gray Atari VGA adaptor and if you dont have a multisync
monitor, some extended video modes with the external clock at 32 MHZ
won't be possible without modifying this adaptor (which is bugged!).

Well I have the Atari VGA adaptor and I do not have a multisync monitor.
And I did not do the damn modification and I cannot find any problems
with the clock at 50MHZ or at 32MHZ on my Falcon. So maybe my adapter is
not bugged as you so claim.

You should have made it clear in the manual what extended video modes
are not possible without the modification and what video modes are
possible with the modification.

Ya know, I've always had good things to say about the CT2, but I have
kept my mouth shut regarding the attitude Centek had towards people who
had questions or problems. Maybe I should post some of the e-mail I have
here which shows what Centek thought about their customers.

I could not believe the language and name calling I read toward the very
people who bought your products.

And while I'm at it, you can damn sure cross my name off your CT060 list.
I'll buy a damn PC before I'll put up with your crap.

Hi

Fortunately most hard disk drivers have a hot key to skip auto booting
(skip running programs from the auto folder) from the drive. It should
be holding down the control key, or alt, or shift.

You can also boot from floppy and run the hard disk driver MANUALLY.
This will then allow you to access the drive.

Most hard disk drivers that end with driver.sys are usually the same
program that can run from an auto folder or from the desktop manually,
by renaming to driver.prg (driver=whatever driver you are usinf.sys).

Some alternate desktops DON'T like being run from an auto folder, BUT
are OK if you set them to auto-boot them (TOS 1.4+).

As the program is looking for a RSC file, the program is a GEM file and
CANNOT be run from the AUTO folder. Only programs that DON'T require GEM
can run from the folder.

If you are running the program via autobooting and it's located in a
folder, it may be because it's needed in the ROOT directory. If not make
sure the RSC file is in the directory with it!

Interesting. According to Epson America's web page, the 460
doesn't exist. Either you are outside the US, or I'm very
confused.

Go to the NVDI drivers .CPX and select the "Epson FX" or "Epson
LQ" drivers if they exist. These were designed for 9 or 24 pin
(respectively) dot-matrix printers.

Compared to what the normal '030 can do, the Falcon DSP is quite good.
Even a MilanII would be able to reach similar signal processing speed,
though.

>> think it will be quite a challenge to be able to use the DSP features
>> of a Falcon on a PC in real time. I have a feeling this may require

If you want to play around with signal processing, even the slowest new
PC you can find these days should be far faster than the Falcon DSP,
using normal C code.

>> some sort of specialized sound card to get a DSP with the same hardware
>> and firmware specs as the Falcon.
>
>The Athlon have some DSP instructions...

So do the K6-2/3 and the PentiumIII.

A $100 Duron can do (peak) more than 2500 million (2.5 billion if you're
using the 'american way' of counting) 32 bit floating point operations
per second with the 3DNow! SIMD instructions (650 MHz, two instructions
per cycle, two float operations per instruction).
Compare that to the 32 million 24/56 bit fixed point operations the
56001 can manage (32 MHz, two clocks per instruction, multiply/accumulate).
It's easier to reach the peak number on the 56001, but that will of
course not come anywhere near to outweighing the 80 times peak
performance difference.

Most DSPs are cheap, low power, devices that do a specific job (signal
processing) well enough. They are no match for the normal desktop/
workstation processors, but you won't find a Pentium in a cellphone. ;-)
(There _are_ high performance DSPs too, of course.)

Running order is important - HSmodem components run just before sockets.prg. Read the HSmodem docs to decide which components to use - English docs are on my web site.

In general, no script whatsoever is required for IConnect.

So.

In the "Modem" box enter port details as required - I just use a modem init string of atz.

In the "Account" box put username and password, plus the phone number of the ISP. Local IP address is 0.0.0.0

"Login" box should just have a "Done" entry plus tick the PPP box

"DNS" box - the address should be 0.0.0.0

"Services", fill out as required. Server names or addresses to taste.

"Proxy" if your ISP uses a cache for http put its address here, I don't know the purpose of the other entries in here (anyone?)

"Sockets", either direct the filepath to the ETC folder, or use an environment path in the magx.inf file.

That should work, if not then I suggest using the terminal that's built-in (pick it from the list of script commands) to determine what the far end is expecting.

This is all the help that I can provide.

>The dialup he is using is from www.atarinet.co.uk where there are
>example stik files kindly supplied by Derryck Croker but alas not

Those scripts definitely worked with atarinet, but try the above.

Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st

```
Here is some C stuff I found in "Atari Profibuch ST-STE-TT".
Only the MultiTOS/MiNT extension is missing (memory protection flags).

typedef struct
{
WORD ph_branch; /* Branch to the beginning of the program (0x601A) */
LONG ph_tlen; /* TEXT segment size */
LONG ph_dlen; /* DATA segment size */
LONG ph_blen; /* BSS segment size */
LONG ph_slen; /* Symbol table size */
LONG ph_res1; /* reserved (perhaps it's used for MultiTOS??) */
LONG ph_prgflags; /* special flags (fastload, malloc from TT ram) */
WORD ph_absflag; /* 1 means: no relocation data available */
}PH;

Program file components:
* Program header (PH)
* TEXT segment
* DATA segment (if not 0)
* BSS segment (if not 0)
* symbol table (if available)
* relocation table (if available)

Good luck
Philipp

FamilyNet HQ: Telnet:\\www.family-bbs.net

Michael,

In all politeness, so far you've not given us anything to look at, and
nothing more than accusations on how it should not be.

My advice to you before you wind up looking like a shiftless dreamer is to
either give us something to work with other than dreams, or continue working on
your drawing board until you can.

I've seen enough people who are all talk. I've had a project or two fall
through that I announced in advance (nothing major... more newsgroup ideas than
programming, but still).

One fine example of great advertising and no result in recent history is
the Tempest PPC board for the Falcon. What a shame.

Like I said, either give us an idea of where you are coming from, or just
let it rest for now till you can.

Sincerely,

Doctor Clu

Hi everybody,

Does anybody around here knows what the header of TOS and compatible executables contains, in between the BRA.S +$16 and the "real" beginning of the program?

Let's say that I would like to know enough about this to be able to write an executable from scratch.

See you,

StudioSON is more of a wave editor. V-Trax, from the same
authors, is more like a multi-track recorder. It's very
easy to use, and is now freeware.

I am not trying to be negative, I would like to see this too. I have seen the Falcon do amazing things using the DSP with is own RAM. I think it will be quite a challenge to be able to use the DSP features of a Falcon on a PC in real time. I have a feeling this may require some sort of specialized sound card to get a DSP with the same hardware and firmware specs as the Falcon.

Too true, get it all the time. Intersestingly my Wife's crappy PC 233MMX, Win98se with a ten dollar sound card and 64MB ram cant play mp3's as well as my Falcons can. The sound card is just that bad, ALS100 avance logic from memory. This is a combination of crappy OS as well mind you. She ended up with Win98 because I needed to play with 98 every now and again and didnt want to stuff up my main PC's.

I am after a basic Atari Falcon 030.
Will swap for excellent condition NEC Pentium laptop with following specs:

P75
40 Mb ram
12.1 DSTN display
1.2 Gb hard drive
Floppy Drive
CD Rom drive
56k/V90 3com pcmcia modem
Excellent battery
Sound and speakers and mike built in
Docking port
2x power supply units
Win 98
Manual (photocopy)
Genuine NEC case

Or just sell it to me for good old cash!!!
Email replies only please to: ian@atari.net

Offset Size Meaning
$00 Word The jump to $1a
$02 Long Length of TEXT segment in bytes
$06 Long Length of DATA segment in bytes
$0A Long Length of BSS segment in bytes
$0E Long Length of SYMBOL table in bytes
$12 Long Reserved
$16 Long Program flags
$1A Word Relocation table flag ABSCODE. If zero there IS a
relocation table.

Program flags:

Bit
0 Fast load: if set only the BSS area is cleared
1 Alternative RAM load: TT only - if set program is loaded to
alternative RAM
2 TT only. If set Malloc is satisfied from TT RAM.
26-31 TPAsize. How much alternative RAM the program considers to be
enough to use.

Roger

You never replied to my requests at all.

> when ? ...

When 2.0 was released, last October IIRC.

> i really try to answer all the emails we get ... may be, we not reply

I've received many requests on *how* to order N.AES outside Germany,
especially from Americans who never get replies from German dealers.

> separatly every bug-report we get, because different things will be
> only forwarded to our programmers ...

I've never received replies to bug-reports either, not from you and not
from the author. In fact, ever since Overscan went down the support for
N.AES has been extremely poor (non-existant).

> but anyway ... now we have again the chance, to deliver a legal copy
> also to you ... please tell us your details of shipping and paying and
> everything should be fine ...

Actually, I won't buy anything from Germany again. Since 1995 I've had
nothing but trouble *every time* I've bought (or tried to buy) something
from Germany. Often the dealer only accepts cheques or cash (prepaid
ofcourse) and the ordered stuff mysteriously disappears in the mail,
sometimes the order is confirmed and nothing ever appears, but mostly it's
not possible to get hold of the dealer in the first place. This is just
not acceptable, and I just won't bother anymore.

Have you set the correct cluster size and minimum number of partitions in the
removable media section of HD-Driver. Set these, re-boot and all should be
well. YOu may have to re-scan drives with MAGXDESK after mounting a disk.

For future reference...

Start the boot and watch the floppy and hard drive lights. At
the moment they first light, press and hold the <Alternate> key.
(At some point (TOS 1.4?) Atari did away with the light
watching, but I still do it out of habit.) The computer will
then boot off of floppy and will ignore the hard drive.

Make certain you have a copy or two of your HD utilities on
floppy as you'll need them to then boot the hard drive.

True, but the conversion process happens far slower than real
time. A test recording took 14 seconds of sound and converted
it in about 3 minutes!

QUiNCY looks impressive. If it will also work with MIDI files
it would be worth the requested $40.

Shiuming Lai wrote:

There was a new version (to me) of StudioSON, so I downloaded
it. V-Trax seems like major overkill for my limited
requirements, but I'll try it out (I think I'd better practice
my French, too).

Thanks to everyone for responding.

Can anyone help me? I just bought a hard drive from a reputable guy here, and I have stuffed the system config in some way by trying to run Thing using Auto-Loader---- now I am getting a really bad loop which ends in the atari telling me EDITH.RSC is not found (quite possible that I left it off with EDITH.ACC), but I can't get into the drive to modify it or get the Auto-Loader program out of the boot up scenario......

I won't be able to contact the bloke I bought it from for some time - how can I circumvent the boot loop which keeps crashing, even just to edit the files and remove the auto-loader which is obviously set up wrongly? eg, can I boot up from a floppy and get the atari to locate the C drive partition, which contains the auto folder and boot acc's?

Thanks in advance for any advice. (Wiping sweat from brow)

Matthew.

I have tried this on two computers. One is a PII 350 with 64 meg of RAM
and a GEMULATOR card with TOS 2.06. It booted the first time and since
then totally, and I mean totally, has locked the system to the extent
where I must turn it off and I am running Norton crash proof.

My other machine is a really vanilla portable. I tried running the
program in mono 640 by 480. It either kills the system or gives me a
barely functional ST which crashes when I try to run software under GFA.
I have not tried anything else since I am afraid of damaging my machines.
My advice is to stay away big time. Unfortunately the history of this
product has been poor. It seems to have gotten more buggy in each passing
version. I managed to get the 98 version to work with the ROM card but
never with a disk image. Obviously the number of serious beta testers is
declining as only strange people have not totally converted to Windoze or
the MAC at this point (or some form of Linux).

Hi Hallvard

Have you tried installing hddriver.sys on the harddisk. Isn't putting
the prg in a AUTO folder just for floppies? Does the harddisk have
enough time too spin up? IIRC I had a program for my STE, on a floppy
, that delayed the boot for x seconds too allow the harddisk to spin
up.

I've had nothing but trouble with gemulator in the past. Downloading each
upgrade in turn to see if it was any better than the previous version.

Then I discovered 'TOSBOX' and have never looked back (Except to my real ST
occasionally.)

If I remember correctly when you would turn on an ATARI that required TOS on floppy and there was no TOS diskette in the drive it would display the ATARI logo and indicated the need of a TOS boot disk.

What type of cycling is the ATARI 520STm doing. With the power off pick up the computer and hold it top side up about 6 inches level over a hard surface and drop the computer flat on the hard surface. If the computer starts working when power is applied then all IC's in sockets need to be reseated. I would reseat the IC's anyway. Make sure the socket clips are on the MMU and the GLUE and are fitted tightly. In early ST's there were padded stickies under the MMU and GLUE, these need to be removed before reinserting the MMU and GLUE into there sockets. I have also had to reshape the contacts of a many MMU and GLUE socket. I have only seen this type of failure in these PLCC sockets of the ATARI. The bigger problem is the PLCC sockets in the ATARI ST's are not a standard pin pattern into the PCB. I have not found a proper replacement in Canada yet.

*** DO NOT *** do the drop test on any computer with a built in drive of any sort, you will damage the internal drive.

Actually, this is handled by the harddisk-driver and not TOS. If you press
and hold Control immediately when the driver is started, TOS will skip the
autofolder and go directly to the desktop. This way you don't have to
bother with a boot-floppy (unless the problem is an application which is
autostarted by the desktop ofcourse).

Hm. After reading all the marketing blurb about the SoundBlaster Live (with
the MP3 option), I am still not sure if they use the DSP on the card to aid
MP3 decoding, or if the do the whole MP3 processing on the host CPU and
simply use the DSP for sound effects processing of the decoded data.

The card does indeed have a freely programmable DSP, unlike most other cards
in that price range. Unfortunately, it does not look like there is any
documentation available on how to program that chip, so it seems creative
labs is the only one who can really use the DSP in their programs :-(

You need to "Install" the driver on the HD. This is not the same as sticking
it in the /AUTO/.

Just run up the driver from the floppy and then use the supplied utils. to
do the Install. This will write a special block of code to the HD boot
sector which searches for and loads the driver file from the HD root
directory (the driver file will be placed there by the install process).

He's saying your "redesigning the wheel". Ever heard that phrase? In other words, why would you want to redevelop what is already there? 68000, 68030, 68040, 68060... this has already been done. Unless there is a new concept to either A) make the computer available to more people at a cheaper cost or B) improve the computer considerably then you are "redesigning the wheel" so speak.

And other "wheels" already exist.

I agree! All those systems have been done. If you want to redesign the wheel
in the Atari scene do a PPC computer. That has never been done before.
Tempest has never been out and never will. Enough of this 680x0 bullshit.
That's age old technology.

Joshua.

Perhaps I've been lucky. Gemulator worked for me the first try
and continues to work fine. I don't know why this is, knowing
little about Microsoft based products by choice.

I think you're correct that beta testing has diminished. Then
again, it was quite nice of Derek to release Gemulator as F.D..

An alternative to the drop test is to take apart the ST's cover (it's not really that hard...make sure you look for a screw under the warranty label) and press firmly on the socketed chips on the board (kindly ground yourself first).

Never had any serious problems whatsoever with various (free) Gemulator versions from -96 upto 2000. Seems extremly stable on my pc hardware (Award based). Also tried on Compac without problems!

I use Gemulator with Geneva+Neodesk on a daily basis and have developed some GFA programs without difficulties using the emulator in 1024*768. The emulator tends to crasch hard sometimes when you make stupid programming errors, thats all.

The internal soundcard can be used too from within the emulator. One of my programs in GFA uses MIDI out and surprisingly it _did_ work on the pc using the built in sounds!

Older versions of STinG works too. I have not tested the latest version yet, but one of the newer versions did not work because you can not (?) run HSMODEM with Gemulator.

Popwatch, Newswatch and CAB runs fine with Gemulator.

I run Gemulator in mono mode all the time.

And, I have no connection whatsoever with Derek M. but if he happen to read this:

A big thank you for giving me a fast ST with bigscreen and lots of RAM and diskspace for free!

It can't find the offscreen drivers. I've had this problems myself, even
though the drivers really are present MagiC can't find them. I solved this
problem by waiting three months before I booted MagiC again. Then it
worked...

> harddisk available by running HDDriver from the floppy, but I can't seem

>Anyone know what this means and what needs to be changed/fixed? I'm

Hallvard,

I can't tell you how to fix it, but I can almost certainly say that it is not a problem with your Magic setup but rather another symptom of your hard-disk problems.

I ran into the same messages when I was having problems with my TT - problems whose ultimate cause turned out to be an over-voltage power supply. Symptoms that I saw as the PSU got worse were

(1) Consistent one-bit errors in files written to the floppy drives or to a Supradrive attached to the ASCI/DMA bus.

(2) Refusal of Magic to boot if HD Driver was on any drive attached to the SCSI bus, but (initially) ok if HD Driver was on the Supradrive on the ASCI Bus.

(3) Strangely, at least at first, problem (2) affected Magic 6 but not Magic 5 (You can tell that by this stage I was getting desperate and willing to try anything.)

In the end, when the TT would not stay alive even in TOS for more than 30 seconds, I stopped fiddling with software, disk-drive connections and memory and put a multi-meter on the 5 volt supply line. It was showing over 7.5 volts and the 12 volt line about 16 volts. When I fixed that, initially by substituting the PSU from my MSTe, all my problems vanished.

I have to agree here, I stated on the other section why not just
help import the hades060?! That post seemed ignored. Hades has
been around ages, just needs drivers for USB cards and such.
Sure it's expensive, but maybe that is cause no one buys it.

In todays age of generic machines, designing one with custom
chips is a huge leak of faith, and in reality not going to
happen. Anyone remember the awesome specs on the a/box?
Well where is it? No where.

It occured to me that maybe cause the service is free, it is some how
limited? Perhaps firewalls or something. You might write this
free provider and ask if IRC is doable and see what they have to
say. Just a thought since I cannot explain it. ;-)

No, I haven't given you anything TANGIBLE to see, as far as this "new Atari computer" is concerned, but that's because I can't. I am simply a lone voice trying to stir the willing imaginations and desires of the people in the Atari community. I am the Steve Jobs, as it were... the sale pitch man... the one who can convince people that something is worth getting into, because I (myself) believe in it so strongly.

Were that I had the $25,000.00+ that I had when I was single, but I doubt, even then, many would listen or believe I was sane.

Tell me, if you had a choice of owning a genuine Atari-brand computer or an Atari clone made by, say, Milan, which would you choose? The genuine product or the modified hack? Naturally, we're assuming that both are readily available where you live and both cost the same.

1208. CDRW a follow-up

Newsgroup: comp.sys.atari.st
Date: 2000-08-02 00:00:00 UTC
From: claytone@aa.net
Message-ID: <3988f182_3@huge.aa.net>
Source record: 59091

Hi all,

I want to thank everyone that responded to my "CDRW QUESTIONS" a while ago. Lots of good info! I finally got a Yamaha external SCSI 8x4x24 CDRW. Officially called "CRW8424SXZ". There are other versions of the Yamaha 8424, such as SX, EX, PX, but most places had the SXZ. I _THINK_ : S=scsi, X=external, Z=software, P=PCI controller, E=... uhh... mc2???. This one comes with a bunch of software (PC/Mac, of course), and a CD labeling kit. I may get a cheap PC in the future, so I thought the software might come in handy. The best price I could find for this model was US$289 (not including shipping), from "www.solutions4sure.com"

I have (Anodyne's) Extendos-Pro vs. 2.4. I wonder if I REALLY need Extendos GOLD, their latest version. I'm still deciding between Soundpool and Anodyne. It looks like Soundpool has their own version of extendos - right???

What I have now (Yamaha CDR8423 and Extendos-Pro 2.4) works - in that I can view contents of CD Roms, and play an audio CD. HOWEVER... I have this photo cd from the last roll of photos I had developed, and my current set-up doesn't see my folder of photo images. I know it's there, because I put it in a Whine-Doze box, and I could see it and view the jpegs. These photo cd's must be "multi session" cd's because the dates for all the included software were from last year, and my photos were done this year. Is my problem that extendos Pro won't handle multi-session cd's? Would Extendos GOLD fix that? What about Soundpool's cd rom driver? Maybe "multi-session" has nothing to do with it. Do any of you have a set-up that allows use of a photo cd?

Oh- and while I'm fishing for info... if anyone else has any more input on Anodyne and/or Soundpool software I'd appreciate it.

Thanks again for all the help!

Hi Hallvard-

A few years ago, I tried putting a WD IDE 2.5" in my Falcon, but
despite my trying everything on my ICD utilities disk, I could
not get the Falcon to see it. So I asked Tom Harker at ICD if he
had any ideas, and he said:

"You cannot use IBM or WD IDE hard drives with the Falcon. Try
"Quantum or Seagate. I have had good success with the Quantum
"Europa series 2.5 inch IDE drives
"and the Falcon.
"
"It is a problem in the timing of the command frames that makes
"them not work with the Falcon.

I also asked Chris Crowchuck(?) at Computer Direct, and he said:

"With the IBM drives, they report wrong sector and interleaving etc. under
"HD Driver. You can set these settings yourself and have HD Driver create
"a boot sector that should work. You are best to avoid IBM and Western
"Digital though for sure.
"
"We have had success with the Maxtor, Seagate, Fujitsu and Quantum drives.

I don't know if that helps, but at least I can now feel good
about saving all those emails from different companies. ;-)

Best regards,

Clayton Murray

1211. Screen Shots of CT2B signals

Newsgroup: comp.sys.atari.st
Date: 2000-08-03 00:00:00 UTC
From: Brian Hutchinson <bthutch@earthlink.net>
Message-ID: <3988F1E6.79676BEB@earthlink.net>
Source record: 58996

Hello,

I'd like to say thanks to those that have helped me with my CT2B installation. I have still not found the problem but thanks.

I have taken screen shots of measurements at all the important connections with a Tektronics scope. These can be seen at the following link:

http://home.earthlink.net/~bthutch/CT2B_screenshots/

Please ignore the rest of the site ... I only created it to put up the screen shots.

The names of the pictures should speak for themselves as to where the measurements were taken.

If anyone did their own installation I'd like to hear from you. I have already talked to many of you and have received good info.

I would be grateful if anyone could comment on the quality of these signals and would be willing to share details of their installation etc. You can email me private if you would like at:

brian.hutchinson@ericsson.com (work)
bthutch@earthlink.net (home)

This Falcon I have used to be one of Ted Tahquechi's from Atari. He used it to make SFX and music for several Jaguar games. If any of you have a big heart and would like to see a part of Atari history live ... please continue to offer information that might help me figure out what the problem is.

If you have missed out on what my problem is just look back for posts with 'CT2B' in the subject line rather than me take up more bandwidth here.

Thanks,

Brian

Hi,
Some HD's have two settings; one for Master or Stand-alone - and one for Slave, while other brands use three different settings; one for Master, one for Slave and the third one for Stand-alone.
2 IDE units on the same IDE-bus is what you can connect. If you need more, go for SCSI...

Hi,
I don't have an explanation, but on my Falcon, all WD disks I've tried have been registered as both Master AND Slave - even though there's only been one drive. I guess the computer doesn't understand where to look for the boot sector or something like that... This detection problem was not present with a PC (probably since it's handled some other way), so the disks worked nicely there - but not with the Falcon :(
I have other complaints about Western Digital as I know for a fact that they've been of extremely poor quality. Maybe their new drives are better, but about 1-2 years ago, I wouldn't have touched a WD disk since I worked as a technician in a computer store and we got so many warranty returns of Western Digital disks that it beat the s**t out of every other brand by a very large margin when it came to warranty replacements...
Maybe Uwe Seimet has a good explanation about these problems?

I don't think it's a problem with the ident, but more a problem in that
the IRC server is unable to do a reverse DNS on your address. I
sometimes get this when trying to connect to funet and, when it happens
the only thing I can do is try another server.

BlowUp 2 has a variable clock, this is much more flexible than just
50MHz. E.g. my old monitor can't even handle the resolutions created with
a 50MHz pixel clock.

> inside the AUTO folder, just to start up the (Western Digital) harddisk,
> which then in turn runs all the AUTO programs, ACCessories etc. from the
> harddisk.

Try using AutoMore (German docs only, download it from
http://homepages.tu-darmstadt.de/~gryf/software/). Place automore.prg
into your floppy's auto folder, together with the following
automore.inf:

```
# Change to whereever you want to boot from
autofolder=C:\auto
# Prevent AutoMore to search for itself in the auto-folder in use
automore=-
```

AutoMore automatically changes the boot drive variable when using a
different Auto folder, so most programs should be fooled into thinking
they directly booted from C:

Note one thing, though: MagiC usually does not evaluate the boot drive
variable, but the drive it was installed on. E.g. if you installed MagiC
onto drive D:, and copy it to C: afterwards, it will still look for its
support files on D:, IIRC.

This might have changed in the meantime, so it's still worth giving
AutoMore a try.

Ciao

Thomas

yes, you will need ExtenDOS Gold if you want to make use of the
Yamaha's CD-burning capabilities. Anodyne also has excellent CD-ROM
backup software available.

The peak on the DMA signal is to low. Should be 1.2v or better. Was this measured at the junction of the CT2 DMA out and the SDMA clock-in pin (wire connected)? If so, remove the wire from the SDMA and check the output from the CT2. You should see an increase in amplitude. If so, examine the modified pin area around the DMA for small shorts from soldering. The trace that comes to the DMA on the motherboard will have a "dog leg" turn before it makes a run to the pin. Be sure the trace is cut in that area, and the CT2 DMA clock soldered to that point. Careful not to lift the trace at that point. If you use a resistor, this is the point of attachment, with the other end attached to ground (on near by chip). This is from A/B experience. Email me if you want.

Because you have to *tell* a WD drive what geometry to use. IDE drives can use multiple geometries (as long as the resulting number of sectors is below the drive's capacity), and most drives have a default geometry active after powerup.

WD drives reject all read/write commands unless you set a geometry - you can use the default geometry that you inquired from the drive ...

This is fixed in TOS 4.06, which won't help you much ;-)

Hy James,

Your problem is very simple. The Demon IRC server doesn't allow your ISP.
Best thing to do is use one of the following servers:

chat.bt.net 7000
irc.netcom.net.uk 6663
irc.u-net.com 7000

Please note that the port numbers are different. I prefere to use different
ports as I get a faster connection usually, but the default port of 6669
should work.

Hope this helps

Source record: 59010

Yes. I measured this signal where the wire 12 meets the resistor AND pin 110 of the DMA chip. The other side of this resistor is grounded on pin 14 of the AJAX.

Do you (or anyone) know what the voltage of the original signal was? I'd like to know what the amplitude (voltage?) of this signal is supposed to be. I asked Czuba what it was supposed to be and all he said was it is fine ... don't touch it. He never answered what the voltage should be.

If I remember right I think the scope said VMax on this signal was 1.96V.

Also a quick update. I've been talking to Robert Schaffner and he had me look at signals:
Right of L102 I see 32MHz
R216 I see 16MHz
J16 pin 32 I see 16MHz
Pin 1 of U63,U62,U68 I think I see 16MHz. I have not done the math to figure this one out ... looks different than the rest but looks the same on all three locations. I'll put pictures of these up shortly.

Looks like I have clocks in all the right places. Why the monitor just blinks and does not lock on to a signal in normal mode is still anyone's guess!

Thanks!!!

Brian

I do not know if this will help.

In Computer Dealer News Volume 15,Issue 40 October 22,1999 pg.12 You find a small write up on a recall of faulty drives made by WD between Aug. 27 and Sept. 24 1999. These drives have a faulty chip which will cause the drive to fail to power up after about 6 to 12 months of full-time use. The article does not specify which model or any other related problems.

On my Falcon, I use one 1.3GB and one 2.1GB Quantum Fireball and they're both quiet and fast. When it comes to IDE, I've had nothing but good results with Quantum (SCSI is another matter...). Seagate also works fine, but they tend to be rather noisy. Fujitsu are good too, but I've had problems with some very large disks.

1228. Re: SCSI connection between MAC G3 and Atari TT

Newsgroup: comp.sys.atari.st
Date: 2000-08-03 00:00:00 UTC
From: Steven Kaleita <sak01@chorus.net>
Message-ID: <3989B938.EB75D9E2@chorus.net>
Source record: 59013

Well, I didn't think that it would be as easy as it was!

I now have my TT connected to my Mac G3 through the SCSI port.

The way I have it connected is...

On the Mac, I have my SCSI scanner.

And On the TT, I have all my Atari formatted external SCSI devices, daisy chained on the SCSI port. (In my case everything is in a mini tower with TWO 50 pin connectors on the case.) I connected a 25 to 50 pin cable from the TT, to the external mini tower, and I connected a 50 to 50 pin SCSI cable; WITH A SCSI through TERMINATOR), between the MAC's scanner and the other 50 connector on the Atari formatted SCSI drives in my mini tower.

In HdDRIVER, I set SCSI arbitration ON, and set the SCSI ID to 6. The MAC is factory set at 7.

In Magicmac 6.04, I have access to all the drives connected to the scsi chain, including the TT's internal HD.

So now I just select and drag files between both computers. (While in the Magicmac environment).

I realize that there is a risk if you try to access the same drive simultaneously by both systems. But, I don't believe TOS ever needed to access the HD on it's own like the MAC does. And while in the Magic environment the Mac doesn't do that. So far everything seems to run safely.

The only thing that I found that I don't like is, If I have a drive or folder window open in Magicmac that is located on one of the Atari drives, and I copy or add a file to that drive, Macicmac won't update the directory. Even if you close the drive and reopen it. And the only way I have been able to do this was to Shut down Magic, they re boot Magic.

If there is a way to reinitialize the external drives in Magic, I still haven't found it. ESC key doesn't do it.

The main reason why I needed to connect my TT to My MAC, was because none of the EPS/AI to CVG converter programs I have, seem to work in Magicmac on the G3. And constantly coping files and swapping disks gets real old, real fast. I also still use my SLM804 for output of the artwork that I do. And some of the CDK's I create are to large to transfer by disk.

I had a null modem setup between the two systems, and it worked fine, but when I needed to copy big files or many files it gets real time consuming. SLOW!!!!!

The only problem that I need to check out farther is, I have an internal SCSI CDRW drive installed in my Mac, and it's SCSI i.d.# is 0; same as my TT's internal HD. I have never had a need to access that MAC CDRW drive while within Magic. So I don't know whether a problem could happen; or if the SCSI arbitration ID separates the two.

I tried to change the LUN setting in Hddriver, for my internal HD, but that just caused me to lose access to the drive on the TT. And I never knew how to change the LUN id on a drive, none of the SCSI drives I have ever came with instruction on jumper settings for a different LUN id.

I dont know about Atari's and IDE's but i belive in the PC world that 1 Master
and 16 slaves are acceptable on an IDE channel, the pull out IDE trays i got
for my friend a while back had an switch to preset the ID between 0 and 16.

Your lone voice is appreciated, though you're obviously new at this.

Alright, some points that need adjusting here (speaking of old car hobbyists). First off, Hasbro has the name of Atari, and owns the rights to the Atari symbol. Atari interactive gaming has made it clear that it plans to focus on the newer platforms. This is a good move for a start, and a logical one. So Atari is once again getting to be a known gaming company. Will another gaming platform ever exist (or computer). Well, computer, I'm fairly certain will never happen again. Computers are doing well with the common platforms we have today. I don't picture Hasbro taking the Atari into the computer market. Hasbro.. toys... video games.. that works.
Gaming system... maybe, but we are talking years and years, and after the current systems like the Playstation and Dreamcast have been and gone, and if the Atari name has carried on well by then.

So things with bonified "Atari" labels on them are difficult. However, there was a time where it looked like Milan might be able to sport the Atari symbol and was talking to Hasbro about that.

Atari Interactive Gaming (I love the sound of that!) has been kind enough to give the ok to developing Jaguar games. As for the ST platform, the TOS system is being rented out I believe.

The fact that a company would develop and sell Atari specific machines are really cool!! Even if that company might not be "Atari", the computer is there. To matter the fact, in many cases, most of the Atari products were

items that were brought from elsewhere and had the Atari label stuck to it.

Such examples that come to mind... the Accustic modem for the Atari 8-bit was the exact same one that company made (CAT?) but with the Atari label stuck over it. I remember dad peeling off the label and finding the original underneath.

The Lynx was bought from Epyx.

The Jaguar, from Flair.

The Portfolio was also developed elsewhere, and just had the Atari label stuck on it. It was simply a handheld PC.

So what's the problem with a Medusa, Hades, or Milan? Atari items, minus the sticker. :)

If you want to be a lone voice, take up pulling together the community to support existing products, to further their developments, to support vendors, provide needed information, work to bring an Atari clone to the states, join chat sessions, etc!

You are only doing what many would like to do as well, but understand, unless you have a LARGE wad of cash for buying of the Atari name and development of a new company (and manufacturing) what I mentioned above is the next best alternative... to work with what is already there.

Hi Matthew!

Yes, I have seen this - it's due to the drive not detecting disk
changes. Some Atari drives are faulty in this respect, in others the
sensor hole can get bunged up or switch damaged. You can usually
overcome it by pressing Esc after changing disks - this forces a
re-read of the directory.

>It could be the drive is going too, since I frequently get the old "The
>data on disk A may be damaged" flag, but won't get it the next day on
>the same disk, etc. And that happens also on disks that I have used
>before the ones I bought in the box.

It could be that the head is out of line slightly. If all else fails,
fit a new PC-type drive - even an HD one will do, used in DD mode. You
may have to chnage one jumper to set the right ID.

I think it's true. The time between each message request and data actually flowing seems to have more than halved!

Have you also noticed that when you connect to the server, it now checks each subscribed newsgroup?

Also I used to get a few zero length messages which would stop the process, but apart from one today that keeps getting stuck after about 2K, I haven't had to press the Escape key much. Here's hoping that one is fixed too! :)

Cheers!

I'm sorry, no. WD drives quite often don't stick to the IDE standard.
This might be the cause for the problem, though it were often old drives
that were not standard-compliant.

Change the LUN settings? You can't set jumpers for that. The LUN setting
in HDDRIVER just means whether HDDRIVER checks for one or two LUNs.
Please also refer to the manual.

IICR (this was a long time ago), there is a difference in the
way that the Atari reads disks. Somewhere on the disk, there is
a code number that is placed there during the formatting
process. IBM drives don't use it, but Ataris do use it to
determine whether or not the disk has been changed.
Consequently, although the Atari formatting software writes a
random code number, most IBM formatters leave it blank = 0.
Thus the Atari doesn't notice that you switched disks....

..Or something like that. Anyhow, once you've used Ataris for
a while you just get used to always pressing the <Esc> key after
you change disks.

Extendos Pro didn't seem to record CD-Audio to disk, while
Extendos Gold does. Apparently, Extendos Pro also lacks the
ability to communicate with a CDRW in writing mode, so I suspect
Gold is required.

I emailed Roger asking if he had tried his writing software with
a Panasonic CW-7502 -- no reply as yet.

I use to run a Western Digital hard drive in my Falcon.
It was a 540 meg 2.5 IDE model number WDAL2540.

I had problems too at first. Back then I had HD DRIVER v.6 and could
not get the drive partitioned with it. So I tried Atari's Hard Drive
software which did see the drive and I was able to get it setup with it.
I even formatted the drive with Ataris software which lots of folks
say is a big No-No. Its been awhile so I don't remember if I had to
format it with Ataris software before I could get it to work or Not.
But after I formatted and partitioned it with Ataris software it worked
fine and I then installed HD Driver version 6. Ran without any problems
for along time. I still have that drive, but replaced it with a 2.5
6.4Gig Toshiba IDE which I didn't format, HD Driver found it without
any problems.

If you haven't already, maybe try using Ataris Hard Drive software and
see what happens.

Well said. I don't know how others feel, but unless one can
re-gain control of the "Atari" name and the full rights to the
old computer line, it won't never really be an Atari company
anyway, just some Atari wanna-be. Yet another clone.

There is CPX that has something to do with sessions.
Have you installed that and given it a try?

I am not sure what it does as I have not such disks
but I see it in the pacakge and I assume it lets
you select sessions such a disk?

btw, the CPX is part of the ExtenDOS package.

I did a bit of checking on SCSI protocol. The SCSI chain apparently doesn't care what's on it -- the TT and the Mac are just devices, same as the hard drives.

>So now I just select and drag files between both computers. (While in the
>Magicmac environment).
>
>I realize that there is a risk if you try to access the same drive
>simultaneously by both systems. But, I don't believe TOS ever needed to access

>Mac doesn't do that. So far everything seems to run safely.

As long as you aren't running a timed program (like a screensaver), the TT shouldn't have to ever access a HD while idling. You could be in serious trouble if both computers went for the same drive at the same time, however.

>The only thing that I found that I don't like is, If I have a drive or folder
>window open in Magicmac that is located on one of the Atari drives, and I copy
>or add a file to that drive, Macicmac won't update the directory. Even if you
>close the drive and reopen it. And the only way I have been able to do this was
>to Shut down Magic, they re boot Magic.

Uh, this means that MagicMac isn't reading the File Allocation Table?!! I'd take that as a serious warning sign!

>
>If there is a way to reinitialize the external drives in Magic, I still haven't
>found it. ESC key doesn't do it.

I'd suspect this would be a function of your HDriver software.

Although I only dabble with SCSI, I suspect you are safe using your Mac as a reading device on the TT's drives. The lack of directory updating is something I wouldn't take lightly, however, and consequently I would recommend you not use the Mac to write to the TT's drives until you understand what's wrong. Perhaps it's nothing, but that directory should update, and its failure to do so might mean trouble.

If I remember correctly I had a similar problem, it was caused by
something rewriting the Magic.inf file. I set the file to be
'read only'. It might be worthwhile checking your inf file & see if
it's been changed.

Has ANYONE been listening to me? THAT'S what I am proposing! That we team together, by whatever means necessary, and BUY Atari back from Hasbro! Gee, you think I just want another Atari clone? NO! I want the original, made by the original! And the only way that will happen is if we have the financial backing to do it! You think impossible? If 1,000 of us donated $1,000 , we'd have $1 million dollars. Not enough? Ok... aren't there more than a thousand Atari users across the USA and across the world? Maybe upwards of 5,000 or more? And who wouldn't join, if they knew their efforts would bring Atari back, better than ever?

As I've said, money will win the day, but how we build our reserves fpor that day is up to all of us!

Something about "Device Initiator" or similar IIRC, you've done the right thing
in using that boot dis. Don't forget that you can configure hddriver.prg in
just the same way as you can when it's installed in the more common way. Just
point the fileselector to the app instead of the sys file.

No no, don't fiddle with that, it's not usable with most Atari computers AFAIK.
Set it to TOS.

That might then fix your offscreen drivers not found and MCMD error messages.

So what's this new machine?

Try re-installing MagiC, that fixed the problem for me.

Also note: make sure the boot partition is the one with the GEMSYS
folder. HDDriver will allow you to boot from any partition/drive (on
startup), but MagiC expects the the GEMSYS folder to be on the
partition/drive booted on.

Later,
Karlos.

On 4 Aug 2000 12:42:57 -, "Jared Falvo" wrote:

|In that respect, you are right. The label doesn't really matter. But I
|figured people would be interested in trying to change the past.

You can't change the past. I don't know if it possible to justly
attribute blame for the demise of Atari, but Atari died because it
could not or would not produce significantly better machines at the
right time. I am sorry that this is so. I am very glad I was
involved with Atari. I bought my first 520 in 1986. I still have it.
I regularly use a 36MHz Mega ST and a Hades and sincerely hope that
I will be able to continue to do so for years to come.

| . . . . . Maybe all you non-American folks couldn't
|care a rat's rectum what happened to Atari or will happen to your clones or
|anything.

I don't think that nationality comes into this at all. I would
suggest that people of many nations deserve credit for keeping the
Atari world going but especially the Germans who saw the Atari as a
serious computer. I use Papyrus, Cab, Coma and OCR (German),
Extendos and associated programs (Canadian), Superbase (?American)
and others of, to me, uncertain origin.

| Maybe all that matters is that something (anything) works for you
|and it doesn't matter who made it.

Not all. If that was all I wanted I could go and buy a peecee for
say £600. Instead I bought a Hades for a lot more in order to stay
with the Atari concept of simplicity and ease of use.

| I just figured that you guys had some
|brand loyalty left in you and would like to see something returned that
|belongs to the people who care.

I didn't leave the brand, the brand left me, and you cannot bring
Atari back to where it was 10 years ago. You might be able to buy
the name but the company and people have gone.

|Then again, maybe what I percieved as a huge popularity with Atari and ST's,
|in the short decade they were around, was just a misconception of my own
|local friends, bookstore, and software stores in nearby cities. Anyone
|remember places like Logical Choice for Computing? Or ComSoft? Or The
|Federated Group? Maybe no one ever really did care and THAT'S why the
|Tramiels killed Atari.

Commercial pressure killed Atari. Do you remember how popular the gramaphone record was? Far more popular than Atari. Do you think that is sufficient reason for abandoning CDs and DVDs and bringing back a needle on the end of a pivoted arm to track wobbles in a plastic groove?

??

There's nothing left of the computer division. There may be
knowledge, but nothing that hasn't been far surpassed by now.
The people (and it's people that make a company) have all
moved on to other things, without them, there will be no new
development and innovation.

What on Earth would a buy-back achieve, when there's nothing
(of significant magnitude to make a big impact in today's
market) to buy back?? What has Hasbro done with Atari? Re-hashed
some old games.

Atari doesn't mean squat to the millions of consumer sheep out
there, and it's those you have to convince, not the handful of
Atari users, many of whom don't spend a penny on their so-called
hobby "because on the PC it's free".

Totally unrealistic idea.

Ok, maybe the idea of having all-in-one was flawed. I am, afterall, simply trying to consolidate a design that will keep things simplest for users and programmers. Maybe what we need is to have slots, but we only install the cards that we support with drivers. A little like Apple's iMac or G4 towers. You get one type of video card in every one, so you know exactly what kind of power/performance you're looking at, plus only one set of drivers needs to be written. Hey, I've seen Nanosaur and Bugdom on iMacs and I am VERY impressed with their graphics! Pangea is COOL! Of course, I would go with AGP 2x minimum. As well, you could design a video display (w/ capture) card to go in that slot, too. So, now, we're allowing slots, but keeping card confusion/hassle to a minimum by writing drivers for only one set of hardware in every system.

And a mini ATX tower design isn't bad... I just wanted to try and keep the original look of the old systems... for nostalgia sake, if nothing else.

Ok, what if we solidified the design, so that we had AGP with say, 2 or three PCI slots, but we filled them all with the same hardware in EVERY unit (let's see, Video in AGP, networking card in PCI 1, sound card in PCI 2, SCSI (or IDE) in PCI 3... any thing esle to go in any other slots)? Now you have genuine expandibility (at the users expense, if there are no drivers for some other card they stick in there), while having all the hardware you'll need (like powerful video, audio and networking) right out of the box. All the users are contacted when any change in the specification is made (i.e. different video cards, sound card, etc.) and everyone gets the latest update for minimal cost. Of course, that means we *might* have some system conflicts (programs breaking on new hardware or not functioning optimally), but that adds to the challenge, right? If all drivers/software were sold to people, everyone would be making money for their effort. I never was much for shareware/freeware. I say, make a time-locked demo version with a self-destructing/deleting installer (so you can't reinstall it endlessly) and if someone wants it, they pay for it. I think that's fair.

By the way, someone was saying how slow their system (Hades060 or Milan040?) was at browsing the web. I don't think it's your processor... it's your video card! If your system only supports low-end cards (ISA or PCI) and has poorly written drivers, just usable enough to provide display for the Atari ST desktop... it's any wonder you can't browse the web worth a hill of beans! My Macintosh Performa 475 (25MHz 040 system) only has 512K of VRAM and it's ok, screen display wise, but when I go to scroll some webpages up or down or to the side, it crawls in some places! I'm sure if I had better video output, I'd have better browsing.

If you get, say a Riva128 or RivaTNT video card (or other high-end card) and have someone really crack out some powerful drivers for it, I am almost certain your web browsing experience will be multi-fold faster. If the video hardware was better in the Falcon030, I'm pretty sure it would be faster at web-browsing, too.

Any ideas?

Luposian

P.S. Here's a question: If you knew we could get Atari back one of two ways, which would you choose (no need to reply if you couldn't care less)?

1) Outright buyout of the name and rights to build Atari computers (maybe as low as $1 million or less, considering Hasbro only paid $5 million for everything).

-OR-

2) Request funds from Hasbro (a couple million for design/advertising) to start up an Atari computer division, but Atari would still belong to them and they would have say-so in how we did business, since they'd be financing our ops. We supply them with our business plan, design specs, schematics, etc. and see if they accept it.

The former is "we own it, we run it." (high investments from all involved). The latter is no investments from anyone. All we have to do is get their approval on what we do and how we do it. Kinda like Atari either being free to run anywhere or chained at the ankles, but allowed to run around in the front yard... :-) I would gladly accept the latter, if I knew I could influence the Next Atari Generation! Hey, owned by Warner, the Tramiels, or Hasbro, if it's made by Atari... I'll buy it in a second! I am fiercely brand-loyal when it comes to Atari or Kawasaki. My two all-time favorite companies. Be, Inc. is in there somewhere, as is Apple, but... Atari takes top billing in my heart and always will. I've been an Atarian since the first 2600VCS (you know, that one with SIX switches?) This new Hasbro Atari is nothing but a namesake nowadays. When they start making computers again, I'm there man! Oh, yeah!

You say you can bring back the Atari name but the people of Atari are gone.
If you're referring to the original designers and staff of Atari, yes... but
WE were/are the TRUE heart of Atari. Without customers, Atari wouldn't have
lasted half as long as they did! If we, the end-users, owned Atari, we
could cater to all of us who know what we want. The reason users are so
frustrated with Apple or Be or Intel or Microsoft, is that they WILL NOT
LISTEN to it's users to any real degree. Oh sure, they have to comply at
some point, lest a stampede cometh, but we don't matter to them as
inidivduals... we're just numbers to them. And that's what ticks me off
most! I wouldn't do that to my customers, in ANY business I ran.

1271. Setting VFAT Partitions in MagiC 5

Newsgroup: comp.sys.atari.st
Date: 2000-08-04 00:00:00 UTC
From: nurmix@socal.SPAM
Message-ID: <8mfgj60fgr@enews2.newsguy.com>
Source record: 58906

I've recently decided to start using VFAT for long file names on a couple of partitions of my hard drives on my Falcon. I'm running MagiC 5.11, and while I am able to set up any _one_ partition to support long file names, I can't seem to get it to do more than one.

I've correctly [as far as I can tell] editied the MAGX.INF file (as shown below):

```
#[vfat]
drives=N
#[vfat]
drives=G
```

I've also tried putting the two drive letters on the same line, separated by commas, or TABs (as shown below):

```
#[vfat]
drives=N,G
```

```
#[vfat]
drives=N G
```

And I've tried switching the letters around, with "G" before "N" - which results in "G" showing the long file names and "N" _not_ showing them.

What am I doing wrong?

This is mine:

#[vfat]
drives=bdefghijklmnop

As you can see you don't need anything between the drive letters! :)

Cheers!

> 1: We are not responsible for your mental instabilities.

I have none. I am perfectly sane. I am just easily moved by mood.

> 2: Some of us are not impressed by your semi-religious pep talk.

I'm talking about Atari, not a religion. Pep-talk, yes. Religion, no.

> 3: Every single poster to this group is loyal. The only reason you may find more
> loyalty elsewhere is because there are more people involved.

Loyalty is the following of one idea, person, brand name, etc. Atari is a brand name. To be loyal to Atari is to say you CAN'T be loyal anymore because Atari is dead. What people are being "loyal" to is the "Atari ghost" of clones made today. I follow the living, not the dead.

> 4: Dont confuse 'loyalty to atari' with 'loyalty to Jared'.

I'm not asking anyone to be loyal to me. I am asking that people show their support for the possibility that their loyalty to the "Atari Experience" (which is what I think best describes owning (or having owned at one time) an original Atari computer) can be restored, because the company may be able to be brought back one way or another.

> 5: About the money; In Holland we have a saying: 'Hou je eigen broek op'
> Direct transletion: 'Keep your own pants up'

I think I prefer the original to the translation. Looks like "How the engine broke up." :-) But, in all seriousness... if no one cares and no one tries, nothing happens. But if one man cares and tries, in hopes that others will also, something CAN happen. Do you want something to happen or not?

> Stop behaving like a spoiled child please!

Spoiled child? I'm 31 yrs old. I have a wife and a boy going on 2 yrs old. How can I act spoiled when I have nothing to be spoiled with. I don't have tons of money. I don't have everything I ask for. I don't always get my way. No, as for spoiled children, look to Bill Gates and Steve Jobs... they've got EVERYTHING!

I'd make a guess that the CDROM on the Atari isn't capable of reading multi-
session disks. Is it an old one?

In the short term use fmc.prg, in the long term install a new drive. Halvard's web site has a very useful and very well presented doc on how to install a Sony drive.

Please don't write any data to floppy until you're 100% sure that it has read the directory correctly, or you'll trash the entire disk.

There is alot you could do with a 68060 setup especially with something
like my Hades060. I would love to have DMA sound, better PCI and ISA
compatibility with the PC world plus alot of other things. To me, a new
Atari computer could only be based on a the 68000 to 68060 chips. In fact I
would love a computer with both the 68060 and the 68000 in it . Then I
could run almost any piece of Atari software. But the biggest thing is like
you said, it must be made at a cheap price so people will buy it.

Actually, for 44.1 you need an external clock (in the programs I
have here at home, anyway). The top speed listed in various documents
I've read and programs I've seen is somewhere around 49.something.

Yes but it is very close to 50Khz. 44.1 is obviously easy but no good for games emulation as only the best PC sound cards can handle higher (96khz-dvd cd), these cards are not cheap...

Falcon's top is definatly 50KHz an external Crystal is needed to run at 44.1. It cant do it Natively.

Body handling: HTML body converted to readable text

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs for NEW Atari stuff!!

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out
into Atari Jaguar Hardware & Games. So check out what's new on my Web
Site. I have 8 different Catalogs, & my SoftWare Catalogs are largest.
They have the biggest Byte Count. Boy! You should see my inventory! I
have Libraries of Books and Reference Material, TruckLoads of HardWare
and Crates and Crates of Software for the Classic Atari 8 Bit, Atari 64
Bit Jaguar Game Machine and the Atari ST and Newer Computer Line!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want to order and E-Mail me the rest of what you do want to order! To
expedite things, include your complete Mailing address so I can figure
Shipping/Postage and Handling. I'll be back after the weekend.

And remember, if you can't come see me today, come see me tomorrow! :-)

Please Direct all Replies Through E-Mail to: bensmith@teleport.com or
atari@benjamin.net. If you cant reach me at benjamin.net see my E-Mail/
Web info in my Signature attached to the bottom of any of my messages!

atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to bensmith@teleport.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

1292. Easy C programming.

Newsgroup: comp.sys.atari.st
Date: 2000-08-04 00:00:00 UTC
From: Jonas Klereborn <klere@physto.se>
Message-ID: <398AB092.BE91EE14@physto.se>
Source record: 58957

Hi all,

I'm thinking of doing some programming in C (or C++). Can anyone tell me what different C packages that are available, and their pro's and con's. I'd be happy if there is some quite easy package that gets you going relatively fast. Good support for window handling and stuff like that is a plus.

I have never done any serious programming on the Atari before, but I have a rather good overall programming knowledge. (Taken some prg-courses at the university)

I have looked at Lattice C and it looks fairly good and easy to use. Is it still available? Whithout a manual it's a little hard to understand the libraries ;-)

Regards,
Jonas Klereborn

From: "Richard Kilpatrick (PC)" <richard@lovecraft.demon.co.uk>
Message-ID: <th3dOOAj$si5EwqI@lovecraft.demon.co.uk>
Source record: 58960

Hi!

I've just acquired an STE system (have yet to see which precise mods have been fitted, but it's 4Mb, HD Floppy, fast serial, TOS 2.06) and I want to use it for MIDI (there's a surprise, eh?). I can find patch editors and librarians for the Roland D10 LA synth, and 110 rackmount, but not for the D-50. Has anyone got experience of using a D-50 with the ST? I'll buy software to use it, anything to avoid having to hook my PC up to it!

I'm also looking for a Roland GS sound editor, for a JV-50 synth. This is more generic I think.

Finally, I have a spare CM8833Mk II monitor, and no display for my STe! Where can I get a cable for this?

Richard (also, will be very happy to be told about demos for the STe! I have loads for my XLs...)

Message-ID: <chBi5.49$sD4.7695@news.goodnet.com>
Source record: 58964

And you WOULD get a better machine.

Tell me... do these Atari clones, like the Hades060 and Milan040, have PCI slots? Oh, they do? Great! Guess you just bought a new [whatever] card and decided to slap it in. It will work, right? Oh, wait... THAT card doesn't yet have a driver for it. Or this one. Or those. Or these over here. But the ones in this box are supported. But... you want THIS one which isn't supported! This is problem one... drivers.

Now, the Falcon030 had problems, as did several older models with some games/apps "breaking", due to differences in TOS or the CPU or whatever. I suspect this problem has multi-fold increased since these hybrids have come out which must jury-rig compatibility in ways Atari never did. And you have problem #2. And what with any modifications to TOS/GEM that have been made, you're probably just asking for even MORE compatibility troubles.

In order to stop these two troublemakers, you HAVE to go back to an all-in-one design. One CPU, one video chipset, one sounds chipset, etc. All onboard. If you allow anyone to add in any card they like, you introduce headaches, botrh for the consumer and the company... or the unlucky one who decides to try to make someone happy by writing drivers for unsupported hardware.

When Atari was alive, they had the 68000 around for a long time. In fact, it wasn't until the TT and Falcon030 that they even changed processors. Smart move. But TOS revisions still caused problems. But patches were easy enough to release and were. We all remember the AUTO folder, stuffed to the brim with all manner of patches and programs. I even recall you having to organize some of those files in a certain order to prevent conflict! But I digress. Atari did a good job, I think. Mighta gotten a bit lazy and stupid later on (around the time of the STe's and beyond), but... everything was still all-in-one. Why? Simplicity. One set of hardware. Consistant. Easy to maintain.

If we were to design a new all-in-one system, we could easily select one of the better 2D/3D graphic chipsets (nVidia TNT/TNT2, 3Dfx VooDoo series, Matrox G400, etc.). Select a powerful audio chipset. Select a fast CPU (40MHz 040 or better). A ton of RAM (32Mb is considered barely usable in a PC, but in an Atari? Whoo-hoo! That's like... TONS! Especially with a ROM-based OS.

Do you have any idea what millions of polygons on an object look like with effects? Probably not, because games for PC's don't come close to maxing out a video card's power. The closest I've seen so far are games like Soul Calibur on the Sega Dreamcast... oh, baby! Where ARE the polygons? You gotta look HARD to find any edges... that's smooth. No Atari computer has

ever seen graphical power like this. Wouldn't it be nice?

And then there's the audio section... I'm sure the Falcon030 had it good enough, but people nowadays want 3D "effects" and stuff. So... give it to 'em! I'm sure the SoundBlaster LIVE chipset will make 'em happy. Stuff that system with external ports, an internal IDE or SCSI interface, Zip drive or LS-120 (if you want to use your old DOS-format ST floppies), CD-ROM (or CD-RW) drive, serial port, parallel port, USB, mouse, etc.

Now cram ALL that into a Mega ST chassis. Ok, maybe you have to make it a wee bit bigger, but... it'll all fit! If you want to make it work in a stock Falcon (i.e. 1040ST-styled) chassis, you'll probably have to struggle a bit more to make it work, trim some of the stuff out, but... it could be done.

All I'm saying is... none of this means anything if we don't get the company back. No one is going to care about having a better clone of a modified Falcon or whatever, if the Atari name isn't there to back it up.

Shoot, maybe I'm just blowing smoke up my rectum, trying to get you people to believe what you're already convinced is impossible and refuse to see anything any other way. Well, it's your loss, really. Go ahead... live in your modified past for what good it will do you. You can use your Hades060 and your Milan060 til you're blue in the face. You're playing with ghosts, my friend. Nothing but ghosts. They're not Ataris and they're not originals. They're nothing more than modified hacks, trying to squeeze what little blood is left in the veins of dying Atarians, like yourselves, in a part of the world that thinks a ghost is just as good (or better) than the living!

Well I don't. I think Milan can't get Hasbro to consent to selling them "Atari" and it's rights (and we'd only be asking for the computer portion) because either they're not offering enough money or Hasbro doesn't want to sell any part of it to a non-US company. There is a chance that they simply don't want to let go of any part of their Atari stockpile under any conditions. That would be a shame. If that's the case, even my efforts (assuming I had enough help... like if any of you really cared anymore) would be futile.

But how will we know if we don't try? How can we even hope to win the race, if we don't run? We need to find out how much would be required, and how many are willing to help any way they can.

Do you really think I'd be standing here, typing these extensively long messages, pouring my guts out, trying to get somewhere... if I didn't believe in what I was saying? If I didn't think we had a chance? Do you think I'm insane? I've got better things to do with my time and energy than this.

Source record: 58966

The TT seems to update the directory when I write a file to the TT's
HD's while in MaciCmac, on the MAC.

It's MagiCmac that doesn't update the directories when I write a file to
an open window of a directory on the TT's Hd's.

So what does that have to do with HdDriver?

I was gonna say Imagecopy, but it's commerical. Gemview should
do it and the key is apparently free for the asking, nowadays.

Ok, so before anything else is said about this matter, please contact
Hasbro and find out! There is no need to go any further with this
discussion until that matter is cleared, since your idea is 100% based on
the Atari name/logo. So, Jared, I don't wanna hear another word from you
until you know if we can get Atari from Hasbro or not :)

Sometimes technology is bought to control the market. Mac did this to a company that made a better clone than the original. Perhaps Hasbro has the same plan. Not the tight control that was done with the release of the Jaguar when IBM did the manufacturing. And nobody even used the obvious add stating the first 64 bit American made game machine. Then Sega made a deal with Atari and they had the nerve to do an advertisment stating poking Atari indirectly saying, 'Your set was stolen.'

Atari users are a small market.

Though if you could get the money and personel to write drivers for many of the standard ISA and PCI video cards. You could help improve the market for the current Atari clones. But this cost big money for non-disclosure agreements.

Is the market large enough for a profit? Could you do it non-profit?

Hi Jared,
I, like many others here (I think), would love to see Atari back into a leading position in the computer market like Apples and PCs have. And it sounds to me like you have what it takes to lead. But we are doubtful and skeptical. I too have dreamed about bringing Atari back... but what makes you think that a completely redesigned computer made with the "Atari spirit" would be any different or better than a Milan? The original Atari team is gone. The only difference between a new team named Atari and a new team named Milan - is the name! It sounds to me like you're both trying to accomplish the same basic thing: bring the Atari platform back with a new system that can handle current video, sound, storage mediums, etc.

And the Milan team has already gained the support of Motorola, Creative Labs, and some other major corporations which I can't remember right now. Plus lots of people are investing their time & effort into programming for the Milan.

I'm not trying to shoot down your dream or anything! I wanted for you to understand why you aren't getting all the support that you expected. I think the Atari name is going to be important if our platform is going to get back into the picture. Maybe we could form an effort to raise funds along with the Milan corporation, so that we can help this thing really happen!

I actually need the source, so none of these are an option. I have already
written a small tool to convert BMPs to a format S25Tool
(Palm-utility) can understand, but I'd like to make something more
flexible and userfriendly.

You live in the 80s. Instead of spending a lot of effort on a piece of hardware which you can't expand, which is 100% unusable if one small component break and most certainly will be the most expensive clone out there, why not spend a fraction of that effort on writing drivers for existing clones?

> If we were to design a new all-in-one system, we could easily select one of

Why not just write drivers for these and slap some ultra-cheap PCI-cards in a Milan?? In fact, I know that one person is writing a Voodoo2-driver for the Falcon right now, it will be easy to port this to the Milan.

You obviously haven't used your Atari the last 10 years. A 40MHz 040 is OK (I know, I have one in my Falcon), but it's still very slow. A 66MHz 060 is better, but also slow. If you want a 68k, you have to accept that all of them are very, very slow by today's standard. And 32Mb isn't much either, I have 68Mb in my Falcon and "only" 52Mb in my TT, and often meets the roof when I use the TT...

> gotta look HARD to find any edges... that's smooth. No Atari computer has
> ever seen graphical power like this. Wouldn't it be nice?

Sure. But I already have a PC that can do that... I want a computer I can put cheap, standard graphics-, network- and soundcards in and use normal applications, not just another games box (I already have a PSX and a PC). And a real computer for real use must be expandable. I *never* want to go back to something like a super-Falcon and after four years end up with something that looks like my current Falcon - a large motherboard with zillions of cables attached because that's the only way to upgrade the CPU, add a graphics-card, soundcard and ethernet-card.

I would buy the computer that...

a) ...use standard components so I could buy my RAM-upgrades anywhere.
b) ...have a modular design so I could just replace a card when the
graphics chip break down.
c) ...fit inside a standard ATX cabinet.
d) ...isn't full of kludges and lots of extra shit just to be able to run
Bubble Bobble without patches.
e) ...had the fastest CPU, preferably something a lot faster than the 060.

"Atari" is nothing nowadays, it's just a name. If somebody is willing to
spend huge amounts of $$ just for a name (and a name that almost
everybody associate with a small, ugly console called VCS2600) I'd
question their sanity.

Which is what I'm TRYING to do. But I figure there is someone more qualified/knowledgeable in how to go about this in the most professional fashion possible. Do you really think Hasbro is gonna listen to us if we look like a few lost diehards asking questions? I think not. We have to do this right. Just because I'm the one squeaky wheel, doesn't mean I'm the best man for the job. I'm simply trying to get others to see my vision, so we can ALL win the day... eventually.

By the way, can someone point me to SOMETHING on Milan's site (in English, please) that gives me information on hardware available, number of users/owners, available software, recent news, etc. I can hardly believe Milan is doing sooo well, when I can't find anything that leads me to believe this. If anything, I'd be lead to believe that Milan's computers were old technology and operations were winding down. And what about this Hades060 I keep hearing about? Who makes it and where is it? Website(s) please...

I still insist the only REAL Atari clone is one without slots. With everything onboard. Reduces driver programmer headaches. Game manufaturers do it (Sega, Sony, Nintendo), so why aren't others? It really IS the best way...

By the way, can someone point me to SOMETHING on Milan's site (in English, please) that gives me information on hardware available, number of users/owners, available software, recent news, etc. I can hardly believe Milan is doing sooo well, when I can't find anything that leads me to believe this. For one thing, an Atari computer made BY Atari, should follow in it's original footsteps. That means, NO slots! It would be better, if by no other measure than that it is all-in-one, reducing driver programmer headaches and allowing optimizations of hardware usage, instead of waste. But I also plan to have GEM optimized in ways that have both been mentioned and not mentioned. It will be a new GEM in a new Atari. People will port their old apps (and others) to the new GEM. In the end, it won't even be an Atari-compatible... it will be an entirely NEW Atari computer altogether! If anyone can buy a card, who's to say if that card will be supported or someone will CARE to support it? If you only have one set of hardware, that question is removed entirely. And you reduce wasted power because, in the new Atari I want to make, a new system wouldn't be built until people has totally maxed out the current hardware and absolutely NEEDED more power/performance. Saves on expense for both the company and consumer as well as programmer headaches and allows people to really see what their system is capable of before moving onto the next one, if they even want to. If no one ever NEEDED anything more powerful than an 040-based Atari, why buy a new one? Just to have it? Pointless.

By the way, can someone point me to SOMETHING on Milan's site (in English, please) that gives me information on hardware available, number of users/owners, available software, recent news, etc. I can hardly believe Milan is doing sooo well, when I can't find anything that leads me to believe this. You are a sad, PC-afflicted individual. You were probably never a genune loyal Atarian to begin with. The system I propose would have an ST emulator for old apps, a new GEM OS, and people/users would port those old ST apps to the new GEM. In the end, if Atari was restored, you would have a new Atari, a new Atari computer, and revive some life into the whole Atari scene (if that's even possible anymore).

The systems roadmap I have is as follows:

Atari Phoenix I; 40MHz 040-based system in a 1040ST case
Atari Phoenix II; 80MHz 060-based system in Mega ST case
Atari Phoenix III; PowerPC-based system in Mega ST case

And on beyond that...

And if you consider it will probably take a while to max out the hardware on each system, let's assume each system will last one to two years before the next one is released. Of course, by THAT time, those chips will probably be no longer made, so... maybe we should simply start with the PowerPC processor, just to play it safe, eh?

This is rubbish. Why should anyone put up that sort of money just to
'know' that the box they have has been made by 'Atari?' Who or what
is Atari? Atari is dead. The machines live on. Faster clones have
been developed and, we are told, are being developed. The important
thing is the use to which they are put and that depends on the
programs. If the programs run on one box as well as on another, what
does it signify if one box has an Atari label and the other doesn't?

> original footsteps. That means, NO slots!

I would never buy a computer that wasn't upgradable. No slots means that if one component goes out, the whole thing becomes trash or requires really expensive repairs! And to say that the original Atari computers had no expansion slots is false. There is NO niche for all-in-one computers like the old Ataris anymore. The niche has been filled with inexpensive and powerful laptops. Do you expect people to start all over again with a different platform that they're unfamiliar with and have to re-purchase all their software for? Do you think people will venture into the realm of uncompatability just because it exists? The only way people would buy an all-in-one unit with little or no upgradability is if it were less expensive and offered something they NEED and can't get with their PC or Mac. And then they're bordering on whether to buy. As soon as you throw in the factors like 1) it's unfamiliar, 2) it's uncompatible with PC & Mac software, 3) it requires one to learn the basics all over again from scratch, and 4) the specs don't look impressive at all compared to PCs and Macs. 80 MHz? HA! Good luck selling an 80 MHz ANYTHING! -- hardly anyone will still buy it. Maybe rich people who like uniqueness and then hardcore Atari fans and techies. Still an almost invisible amount of sales.

Ya know, the Milan (if it's ever marketed) will suffer heavily from the same things. It will be a miracle if they acheive market penetration. And guess what's going to happen? Microsoft, Apple, and all the other companies are going to take the great ideas presented in the Milan and implement those ideas into their products. It's only a matter of time before their operating systems move from disk-based to ROM-based.

altogether!

If you take backwords compatibility out of the picture, you will lose a lot of support by Atari fans. Especially when there's other Atari based computers which DO have backwords compatability.

In that respect, you are right. The label doesn't really matter. But I figured people would be interested in trying to change the past. To bring back what was so violently taken from us. Assuming anyone cares, that is. Maybe I'm the only one. I dunno. Maybe all you non-American folks couldn't care a rat's rectum what happened to Atari or will happen to your clones or anything. Maybe all that matters is that something (anything) works for you and it doesn't matter who made it. I just figured that you guys had some brand loyalty left in you and would like to see something returned that belongs to the people who care.

Then again, maybe what I percieved as a huge popularity with Atari and ST's, in the short decade they were around, was just a misconception of my own local friends, bookstore, and software stores in nearby cities. Anyone remember places like Logical Choice for Computing? Or ComSoft? Or The Federated Group? Maybe no one ever really did care and THAT'S why the Tramiels killed Atari. Maybe what's left of Atari at Hasbro is the best place for it. Maybe I'm just wasting my time trying to convince people of something only I believe in and have great affection for.

I'm depressed... think I'll go build another PC and stick BeOS R5 on it. At least I *know* there's some loyalty to that platform and far more than I've found here this week.

I've had Ataris for more than ten years now, and I believe I've been a
more loyal Atarian than most people. Judging from what you've been
writing in this thread I'd also say that I'm much more of an Atarian than
you have ever been. Take a look at my homepage (see sig) and see the
amount of time, money and effort I've been putting into my Ataris.

What's sad is your passion for the name "Atari", and not the
technology. Are you aware that Atari's last Falcon (never released) had
slots? Or that Atari made lots of PC's in the 80s? Atari has never made
exciting hardware, they bought it from others. With a bit of (bad?) luck
they would have bought the Amiga as well, if that had been the case would
you have liked "slots" then?

> for old apps, a new GEM OS, and people/users would port those old ST apps to

Emulator?? Then why not just buy a cheap PC with an emulator?

>unlucky one who decides to try to make someone happy by writing drivers for
>unsupported hardware.

"All-in-one design" = VERY limited upgradability and tough-to-get
replacement parts. The reason there were software compatibility
issues were that the software was designed to access very specific
hardware (important if you want relatively slow technology to work
very quickly). The smarter move would be to use standard PC parts,
which are very inexpensive, but still high quality, write drivers for
them, and make the software less hardware-specific. I would
personally prefer to be able to grab a PCI card and throw it in
when I need better graphics than to be stuck with a built-in graphics
processor that will be obsolete next week. The push should be toward
writing drivers for the most common cards. I'm sure writing a
driver for cards made by some other company is in many cases
cheaper and easier than constantly re-designing hardware and forcing
the user to keep having to buy a whole new computer every time.

>When Atari was alive, they had the 68000 around for a long time. In fact,
>it wasn't until the TT and Falcon030 that they even changed processors.

If you don't change processors to keep up with technology you
eventually get machines that are unusable with modern applications. I
personally don't find it very fun trying to simply web browse with my
Falcon any more because it's dead slow!

>Smart move. But TOS revisions still caused problems. But patches
were easy

>(40MHz 040 or better). A ton of RAM (32Mb is considered barely usable in a
>PC, but in an Atari? Whoo-hoo! That's like... TONS! Especially with a
>ROM-based OS.

This is basically what the Hades and Milan do, except they use cards
instead of "all-in-one" integration. Plus, a short while later, the
Hades and Milan owners could plug in a few cheap, new cards and be
all set (assuming drivers are written) and your machine would be
stuck waiting for the next full computer to be released.

>Now cram ALL that into a Mega ST chassis. Ok, maybe you have to make it a
>wee bit bigger, but... it'll all fit! If you want to make it work in a
>stock Falcon (i.e. 1040ST-styled) chassis, you'll probably have to struggle

>done.

Why does case style matter? Just make the motherboard fit into any PC
case (as does Hades and Milan), and you can mix and match any acse
you want!

>All I'm saying is... none of this means anything if we don't get the company
>back. No one is going to care about having a better clone of a modified
>Falcon or whatever, if the Atari name isn't there to back it up.

I don't know of anyone anymore other than us Atari owners who even
knew Atari made anything but video games, if they know the name at
all. And from a distribution point of view, Atari screwed over many
of their US distributors that I've talked to, so if anything Atari's
reputation is a negative one, if known at all, except for those of us
who already admire their machines. If there is to be a resurgence in
the Atari market, name really doesn't matter as much as the quality
of the machine.

>Well I don't. I think Milan can't get Hasbro to consent to selling them
>"Atari" and it's rights (and we'd only be asking for the computer portion)
>because either they're not offering enough money or Hasbro doesn't want to
>sell any part of it to a non-US company. There is a chance that they simply
>don't want to let go of any part of their Atari stockpile under any
>conditions. That would be a shame. If that's the case, even my efforts
>(assuming I had enough help... like if any of you really cared anymore)
>would be futile.

Atari's "stockpile" would now need to be seriously re-designed anyway
in order to me feasible with today's applications - to the point you
wouldn't be able to recognize then as what they were. How is this
different than those making the Hades and Milan?

Basically, my view is that Atari's old designs are too obsolete to be
salvagable. Plus, no one makes parts for anything but PC-compatible.
It would be a total waste of time and money. These resources would be
better spent on marketting (strangely enough the same concept that

Atari completely missed). It really doesn't matter how the computer is put together, as long as it is of excellent quality, reasonably affordable, and works as expected. Cards would just make upgrading easier - that's why the concept was invented in the first place. That's the one thing I didn't really like about the pre-Falcon/TT Atari's was that you couldn't upgrade without incredibly difficult DIY hacks (isn't that what you're against?). So instead of fighting those who are struggling to keep Atari-compatible machines up-to-date and available, why not just help out, or at least shut up and let people create? Anyway, I'm done responding to this meaningless ranting.

You don't get it. We *don't* care about Atari or the Fuji, because Atari
did nothing but let us down for many years. But we *do* care about this
platform, regardless of who makes the hardware. TOS, MiNT and MagiC is
what matters, and some piece of hardware to run it on. It could be a PC
with a 040 instead of a Pentium for all I care, but it must have TOS on
ROM and run MiNT or MagiC. The days of playing with registers in every
piece of software is over - thank God.

Thanks to the people who designed and manufactured my Afterburner,
Eclipse, Yamaha soundcard and maxitower I now have a fairly powerful
computer - Atari had nothing to do with it. And IMO that's good, they
would have messed it up anyway.

>btw, the CPX is part of the ExtenDOS package.

Sessions cpx is for managing back-ups on a CD. If you back up a partition
and then look at the CD you'll see the files you backe-up. However if you
then do another back-up to the same CD then the only files you'll be able
to access will be the last ones you wrote. The earlier back-up disappears
It's still there but you need to use the cpx to set a 'pointer'? the the
set of files/back-ups you want to use.
Presumably Extendos writes some sort of index system on the disk each time
a batch of files is written, clearly it is not possible to overwrite a
particular index on a CD that is not rewritable.

^^^^^^^^

So.. how do you like the TT? Or the mega ST? They had slots (VME and MegaBus). The "No slots" theory, in my opinion, is pure bullshit. Expandability is what I would look for when I get a new machine. Even if I were to buy a PC, I would look at how many cards it could take at once. Don't get me wrong, I like the ST and its design too, but even we Atarians have to move on. This is why I bought a Hades060. Sure, drivers for good new cards is a problem, but then again.. if I "forget" that the Hades has PCI slots.. I have a very fast TT :-) AT this time I have at least Both decent graphics and sound in the Hades, which is more than I can get on the TT.. and it is prefectly compatible with the TT. I think Michael Schwingen is completely right.. put a Atari badge on either Milan or Hades, and you've got your dream come true!

All-in-one designs are way to limited these days. And while you can shout PSX, Nintendo, etc., all day, I'll just say "They're not computers". Also, look at the lifetime of such a console.

> other measure than that it is all-in-one, reducing driver programmer
> headaches and allowing optimizations of hardware usage, instead of waste.

Well, as suggested by someone else.. put all that energy into writing drivers for Milan/Hades, and you'll have a machine that is better supported than a new "Atari machine" will ever be.

Has anyone ever encountered floppy drive problems like this on an ST?

-Sometimes after running one floppy, the drive either won't update when a new one is run (ie, the wrong info remains from the last disk), or else it can come up blank despite there being files on the disk. Yet sometimes when I switch to the "B"icon for the same (one) drive, the right info appears.

I recently found to my joy, a large box of very well-kept DD floppies in a 2nd hand junk store; I have had some problems in getting them to run in some cases (I believe they were used on an amiga originally from some of the labels).... I don't think the floppy probs are directly related to this - I may be wrong though, perhaps to do with how the A/B drives mess with memory? Not sure... in any case, if anyone has any tips on what could be wrong I'd appreciate it.

It could be the drive is going too, since I frequently get the old "The data on disk A may be damaged" flag, but won't get it the next day on the same disk, etc. And that happens also on disks that I have used before the ones I bought in the box.

Thanks again for any advice, sorry for the long complicated description...

Matthew.

I try the Makedisk 1.4 program to converting *.st files in a disk format to use in the real Atari machine. My problem is that this program can't do it with any disc that I have. In all the disks the error message is "Bad Sector". I allow the option to format the disk before, and the problems continues.
Can you help me?
Thanks

Hi all,
#1--- only a million $ eh? Not enough people here would even pay for
Javascript added into CAB (assuming Alexander Clauss/ASH were willing).
#2--- "a couple of million for design/ads" --- a better idea (same
reasoning as #1). Ok, one TV commercial in the USA alone (not in the
6 o'clock news/Seinfeld slot) and there goes half the budget!
I share the dream also but reality must be taken into account in order
for the dream to be realized! As far as I'm concerned, Warner, Tremeil or
whoever had no successfull marketing stratigy or I would have heard of the
Atari COMPUTER (not only the 2600/5200 game) before a friend talked me
into buying my first ST. Atari/Hades/Milan computers are out here solely
by word of mouth!!! That's not good enough to revive the 'Atari' name!
Example: Cable vs. Satellite TV (just an opinion here, as is the above)
There was no coherent marketing stratigy by the Satellite dealers in
the USA but the Cable consortium had one. The result, antiquated copper
wire burried all over the place and local laws banning ANY antenna in
subdivisions!!!!!
How about a third option------maybe Gates is'nt busy! (:-)~

Really? IDE is definitely only two devices per channel.
They are 40-pin, whereas the SCSI ones will be a high
density 68-pin job. I'm quite sure of this as I've used
both types.

PCs do use the same principle. Just try ejecting a disk
or CD before Windows has finished with it and you'll get
a nice blue screen requesting disk with serial XXXXXX
be placed back in the drive.

I am in touch with SySol and now with Olaf about the translation -
apparently he didn't get my original message.

>Do tell us what's wrong with the translation, please.

The main thing is the common German failing of translating 'eventuell'
as 'eventually' instead of 'possibly' or 'that may be present' and
'aktuell' as 'actual' where it should be 'current' or 'up-to-date'.
Also there are a few other small things as well as hundreds of
superfluous commas and some German left in. I have asked Olaf to send me
the text of the revised version he is preparing and I'll look it over.

BTW - has anyone managed to extract the SMURF.HYP during installation?
I can't do it, even when putting a (spare) GUIDES folder on C: where
Smurf looks for it, I'm told, and *also* putting the correct path in
magx.inf: #_ENV HYPPATH=D:\ST_GUIDE\GUIDES\.

Probably putting in spaces or other separators. My magx.inf reads:
#[vfat]
drives=bgh

and this works fine. BTW it's worth making B: LFN-capable just in case
you get a floppy from someone with LFNs - just stick it in the drive and
select B:

Now this is the most intelligent suggestion I've seen in this thread yet!
Import Hades/Milan, scan the market, find out where the TOS platform stand
in the US. I don't think anyone would object to having the Atari badge on
the machine, but I strongly believe that it is the "feel" of the machine
that matters, i.e., that it runs TOS, MiNT or MagiC as its NATIVE OS. So,
how many of you Americans reading this group would actually buy a
Hades/Milan if imported by Jared or Lonny? Speak up! :)

> > Sounds good, but let's have 4 PCI slots....

how about going the full nine yards and putting in 6 PCI slots? That way you'd really be covered for a variety of functions the system could be designed for. There's still quite a few Mac users out there in the graphics and design industry who are SCREAMING at Apple to re-introduce a 6-slot Mac like the 9500/9600 systems, but it's falling on deaf ears. (Why? well, these guys need that many slots, like for dual monitor support, fast SCSI, digital sound recording. etc.)

I'm using a UMAX c600 Mac clone right now, it has three PCI slots and I've already filled them (Ethernet, more powerful graphics card, USB card).

Personally, I'd like to see a future Atari-system that included all those slots so you could add additional MIDI out ports, additional USB ports, FireWire, killer graphics cards (3dFX, ATI), SCSI, IDE, etc.

It's hard for me to believe that the next president of the United States will be George W. Bush or Al Gore. Both remind me of Hollywood movies that have been focus-grouped to death: they push all the appropriate buttons, but have zero original vision. Both stand for the same thing: corporate-driven business as usual.

There must be some way outta here.

Ralph Nader is no joker or thief. I think he and the Greens could give Al & George a good run for their money. At 65, Nader isn't running as fast as he used to, and the Green Party doesn't exactly have its platform figured out, but I think they have what it takes to inject a dose of radical democracy into the race. Unlike the two Tweedles, Nader is real, he stands for decency and common sense and he still commands a lot of respect in progressive and activist circles. And hidden behind the rainbow coalition of lefties, eco-feminists and crazies, the Green Party does have some great ideas. It's the only party that stands for the Tobin Tax, true cost markets, media reform and putting corporations in their place.

In October, with a fired-up Nader hurling intelligent sound bites into the presidential debates, the whole game show might actually be worth watching. The alternative is the most sophomoric presidential race in American history . . . and the lowest voter turnout ever.

I'm putting a GO GREEN - VOTE NADER graphic at the end of all my emails from now on. I'm betting that, between now and November, the American people will wake up to the fact that their sacred democratic experiment has now degenerated into a choice between a corporate-sponsored Republican and a corporate-sponsored Democrat.

In these heady post-WTO days, a sudden, massive protest vote against Al & George is entirely possible and Nader would be the most apparent heir. With perhaps less than 25 percent of the people voting, an inspired Nader campaign could grab a surprising share of the action. And even if he does not come close to winning, at least imagine how his campaign might pull together some of the fired-up, post-WTO forces and lay the groundwork for something really visionary in 2004.

Download the graphics and help launch an email pyramid scheme to dump the Tweedles! Two formats are available, a magazine

sticker (17K) or a Banner ad (5K):

==========

What it Means to be Green

"At the root of all Green political action is nonviolence, starting with how we live our lives, taking small, unilateral steps toward peace in everything we do. Green politics requires us to be both tender and subversive. Affirming tenderness as a political value is already subversive. In Green politics, we practice tenderness in relations with others; in caring for ideas, art, language, and culture; and in cherishing and protecting the Earth. To think Green is to build solidarity with those working for social justice and human rights everywhere, not bound by ideologies."

-Petra Kelly

First, try the site address without the .html:
http://www.therapy-seriouz.de/

Then ask System Solutions about the Handbook translation.

Do tell us what's wrong with the translation, please.

Charles.

I have 3 Macs here at the house, one with an 030@16 Mhz, the 2nd with a 030@25 Mhz and an 040@25. If I install the same Video Card in each machine with the same version of MAC OS just to make it fair, the Web gets smoother and faster with the same video card the faster the CPU is. On the 040@25 it's dramatically faster than on even the 030@25 machine. I know a fast video card can speed things up but the slowness with Netscape on the older Macs from all my experience is not the video card but the Mac itself and the OS and the CPU. I can install that same Super Mac video card in an even faster Mac and Netscape is even faster. Games and 3D apps benefit most from a faster video card. Don't get me wrong, a SLOW card can slow down the entire system but with the Mac you are talking about it's not just the video. I have a 486DX2/66 with a 2 meg VLB card and Netscape is much smoother and faster on it than on any of my Macs.

I love the old Atari computers but they are just that - Old Technology. I would have nothing against Atari making a comeback but I doubt it will happen and if it does whoever runs it better go with some newer technology like at least PPC. The 68000 is rather dated for today's needs.

Dennis

If you think of Atari only as a brand, then I really am not interested
in your ideas. It seems the machine itself is less important to you than
the location where it is built, and the name on it. The clones is what
is keeping atari world going today, whether you like it or not. Ok that
might change, but I question your motives..

There is an auto folder utility called FMC.PRG (Force Media Change)
which can sort this out. Sorry, I don't have a URL as I got hold of it
from a cover disk in my pre-net days.

>you select sessions such a disk?

I can tell you about that. The sessions CPX file is vital when using CDBackup. When you backup your hard drive to a CD it puts all the partitions you have on the CD, but (after the backup is complete) and you click on the CD icon, only the first partition (usually C) comes up. To get the other partitions you need the Sessions.CPX file. It allows you to choose which partition you want the CD icon to activate and bring up on the screen.

I agree here, but when this thing happens I do not think the comouter made
will be like the old ST. It will be somehting like the Hades or the Milan,
but under the Atari name. Now I think it should be able to run ST software
and be able to bring it up on a SVGA monitor which is why I think it should
have a 68000 chip in it just for that one purpose.

>cards that we support with drivers.

In this day and age you are correct. Slots and upgrading are the keys here.
No one wants a computer they cannot upgrade, but then how many PC owners
buy new computers when the new systems come out.
>
>And a mini ATX tower design isn't bad... I just wanted to try and keep the
>original look of the old systems... for nostalgia sake, if nothing else.

That still can be done, but the newer Atari flagship computer must have all
the bells and whistles. Now a nice little lap-top Atari computer would be
just great especially if it had MIDI ports.

>Ok, what if we solidified the design, so that we had AGP with say, 2 or
>three PCI slots, but we filled them all with the same hardware in EVERY unit
>(let's see, Video in AGP, networking card in PCI 1, sound card in PCI 2,

Sounds good, but let's have 4 PCI slots....

>By the way, someone was saying how slow their system (Hades060 or Milan040?)
>was at browsing the web. I don't think it's your processor... it's your
>video card!

To some extent you are correct, but I believe the slowness may also be due
to the software and how it interacts with the video card.

>If you get, say a Riva128 or RivaTNT video card (or other high-end card) and
>have someone really crack out some powerful drivers for it, I am almost

>faster at web-browsing, too.

I agree.... Let me say that web-browsing with my Hades060/Cab 2.8 is not
all that slow. CPU speed is also a factor that should be addressed which is
why the new Atari computer should be PowerPC based....

>etc. and see if they accept it.

Well I would like #1 to happen since then we could run it as we see fit,
but I would not complain if the #2 situation happened. One guy had it right
we have to first make sure that Hasbro would be willing to sell the
computer rights to make Atari computers and then for how much???

Hi Richard.

You can go to my site and download Hybrid Arts GenEdit (now Freeware)
which has a D-50 Template. Unfortunatly, there are no docs. I am trying
to obtain some, or have someone write up a short Tutorial on it's use.
However, you might be able to figure it out. I mostly use XOR which has
a D-50 editor as well. Please Email Privitly on this.

There is also C-Lab Explorer (now Freeware)which is available on the
Atari-Midi FILE SECTION link on my page as well. Even though it is
meant for D110 and MT32, I think I remember you can configure it for
any of these instruments including the D-50.That is an excellent editor
with great graphics .

>
> I'm also looking for a Roland GS sound editor, for a JV-50 synth. This

Perhaps Gen Edit will do there as well, as you can create your own
templates.
>

You can get a Cable to use a regular VGA monitor on an ST at Best
Electronics or Marios B.'s site. Go to my LINKS on my page, and you
will find those plus more.

I have this mono gfx card wondering if anyone wanted it. I have no use for it. It has the 15 pin vga connector on the back so I'm assuming it works on VGA monitors. Also there is a bunch of drivers disks. I have never tried it so I can't say for sure if it works. But if someone has need for it please email me at lord_gaiyan@hotmail.com I won't charge anything for it but if you want to trade a piece of software for it like HiSoft Basic or some C compiler, that would be great. I'm in Finland for another week then I'm moving back to Canada.

Joshua.

VISION is shareware (but full use of any feature) and can handle images
conversions in any supported format including BMP and IMG.
By the way, it is more efficient (for disk usage) to convert from BMP to
TIFF with LZW compression,especially if you have a 030 based machine.
Have a look at
http://vision.atari.org or http://www.multimania.com/jlusetti/indexe.htm

Hi Jared

>Of course, by THAT time, those chips will probably be no longer made,

>so... maybe we should simply start with the PowerPC processor, just to play it
>safe, eh?

Maybe we should pull our heads out of our arses and look reality in the eye. If there were that many die-hard Atarians around then Atari wouldnt have gone bust to start with, so how the hell do you plan on a revival with that sort of attitude prevailing. The current clones are gagging for breath and they are very compatible with current software and you propose a system that needs software being ported to it, face up to it, that machine and its portings are here already, phone Will gates for a quote.

1367. Updates of HDDRIVER and DISKUS

Newsgroup: comp.sys.atari.st
Date: 2000-08-05 00:00:00 UTC
From: Uwe Seimet <us@ooc.de>
Message-ID: <398C3D5D.FDF5D816@ooc.de>
Source record: 58937

Hello!

Please note that until further notice registered users of HDDRIVER and
DISKUS can now get updates also by e-mail. Sending me the original
floppy disk is no longer required *if you're already registered with
me*.
What is required, however, is sending me the update fee :-). Payment
can be done in DM or FF. Please see my updated web pages for further
information and update prices:

www://home.nikocity.de/nogfradelt/updates_english.html

The current version of HDDRIVER is 7.9. The current version of DISKUS
is 3.8. You find general information on both products here:

www://home.nikocity.de/nogfradelt/atari_english.html

Best regards, Uwe

>>there's a free implementation available?

>Graftool maybe?

Indead Graftool can do this (both ways)

ftp://chapelie.rma.ac.be/atari/graph-tools/gt970907.lzh (222.568 bytes)
or http://ourworld.compuserve.com/homepages/JJvB/

One can also try Nview
http://perso.wanadoo.fr/pierre.g/home.html
or ftp://chapelie.rma.ac.be/atari/graph-tools/nview280.zip (412.641 bytes)

Furthermore the excellent Looknsee (Zeigsmir) is also able to view BMP and
convert then to another format.
Looknsee is registerware. You need to write to the author in order to get
a registration key.

Source record: 58940

Hi Steven
> It's MagiCmac that doesn't update the directories when I write a file to
> an open window of a directory on the TT's Hd's.
Perhaps there is a cache program activ on the MAC side?
For me it sounds as if the MAC doesn't access the drive at all.
Perhaps you could check the "write LED" of your drive while actualising
the drives content (press ESC).

The problem is that your MAC doesn't know that anything has changed on the
TTs drive (there is no protocol to inform your MAC about that). So the
caching program (or perhaps it's built in the OS?) takes the data from
the cache (=memory) and not from the drive...
--> you won't see any change.

Or perhaps there is a caching problem in MagiC Mac? Try to use
SHIFT+ESC to force a "media change"... so any caches are flushed and the
data is reload from disk. (I don't know if that works with every desktop)

I cannot agree more!
It's worth noting that my first computer was an Atari 8-bit back
in the very early 80's. I've owned nearly every model that
has come down the pike, switched to the ST the moment it was
available. I kept swapping my ST for newer models just as
before, until I arrived at the point I am now with just a TT
and a Falcon. I have not purchased any other brand whatsoever,
I've had many try to get me to do so over the years.
As far as fanatics go, I am a *rare* bread of Atari user and
I don't know that many that stuck with Atari as tightly as
I have. I am by no means trying to put down those that have
dual platforms. What I am try to say is that even a fanatic
as myself who has owned not one other platform but Atari,
has come to grips with the reality that Atari is gone as
we knew it. It will never be the same.

I also don't have a wife and kids, so I do have some money
and could probably easily become an hades or milan distributer.
However that is not something I wish to do entirely on my own,
so I doubt it will ever happen.

Since I refuse to order over seas, I'm am finally considering
a second platform after all these years. Why, because even
if I get a hades I'm stuck with some really lame stuff like
CAB. So there you have problem number 2, software support!
If I have to run Linux to do stuff, well it's not GEM so it's
far more cost effect to get so other popular platform and keep
my TT for the old stuff I do love.

Jared, and don't use my buying another platform to promote your
US revival either! I've been saying it all along since your
first super hyped post, import the existing clones and the
platform will grow. Who the heck cares where it's from as
long as it runs the software I love!

we knew it. It will never be the same.

I reply:

You're right. It won't be the same... it will be BETTER! We must all realize that Atari IS gone. Dead. And nearly forgotten! But, that's why this plan is so great... when you forget how excited you were when Atari was first revived (by the Trams) and the dust settles and the folks have all gone home, THAT'S when someone like me comes around, pulls off a cool stunt, and everyone get's excited again!

I can not guarantee my plan will work, unless Hasbro is willing to budge. But... IF! That's the key work. IF!

"IF" we were able to pull off the revial of the Atari computer division, and we made a new system, such as I mentioned in one of my first posts, would you buy that system, if you knew it was better than the Milan and fully supported by Atari?

Since the US is where things would start up again, it might take a little while to get things over abroad, but I promise you we would do it ASAP. We might even have someone there with our vision, start up an Atari division. Who knows.

I've got ideas for printed ads and cable commercials that just tickle me pink with excitement. But we need to start by getting people like Baiz and others to join in the team. formulate a plan and execute it with EXTREME prejudice... against the Tramiels! :-)

This is an interesting thread, but we've seen it before. There are too many different kinds of Atarians with different interests in too small of a user community to believe that there are enough who love the charm of a machine with a fuji on it - a living legend - to pay the bills for a revival. Introducing a new machine takes a lot of money and management backing. Little guys like Wizztronics can't do it. Bigger guys like Milan are having their share of troubles. It's much more than garage engineering and contributions from friends.

Myself, I'd like to see a PowerPC platform with native TOS in ROM that was capable (even with an emulator) of running properly-written ST software. Guess I'm not going to see it. (didn't really expect to.)

> Now this is the most intelligent suggestion I've seen in this thread yet!

>how many of you Americans reading this group would actually buy a
>Hades/Milan if imported by Jared or Lonny? Speak up! :)

Here's one. Here's a guy hoping that Milan Computer really pulls it off and produces something that the far more open-minded Europeans can support. Here's someone hoping that the Germany-to-US distribution problems (which seem to plague every single product) can be battered down. Here's someone hoping that next year, I can send a cheque to Systems For Tomorrow for my Milan II, whether or not it has an official, Hasbro-approved fuji on it. Which, if it did, would certainly make it much more interesting!

Uwe.,

Yes, The HdDriver manual does cover how to set the LUN I.D.' #'s and also the SCSI arbitration. But I'm not that versed on the technical stuff when it comes to computer systems. All my knowledge comes from what I've read over the years, and simply playing around. Most of the stuff make sense to me and some of the stuff leaves me guessing. So changing settings on things that I honestly don't know what will happen, is something I avoid; until I hear from respected people as yourself; on weather I'm doing the right thing or not.

I've been a registered HdDriver user for around 6 years now, (maybe longer) I am however; only using version 5.13....It's been working fine for me.

Thanks for a Great program!

Phillipp,

In regards to, the MAC & Magic reading the Atari Drives...

When you first boot up MagiCmac, it accesses all the Atari drives. I know that with TOS 3.06 on the TT, if you press the ESC key it re reads all the HD directories. I realize that Magic is not TOS so I didn't know how to re read the directories in MagiCmac. It might be in the manual, but I couldn't find it.

Shift ESC worked!

Thanks!

So Far everything seems to still be working, And after checking things out with Diamond Edge, I did get a few minor directory errors, but I think they were caused by some of the playing around I've been doing, and appeared to be unrelated to the files I copied between the MAC and the TT.

The mac doesn't seem to care when I don't have the TT booted up, even though it's still connected through the SCSI port.

And the TT doesn't seem to care when I don't have the MAC booted up either!

IF I boot up the TT after I have been working on the MAC for a while, and then load MagiCmac, all the Atari Drives are accessed and everything seems to work just fine.

So the conclusion I come to is...

WOW!

This is Great, This is COOL, and I thank everyone for their help.

I don't know if this is classified as networking; but I don't care, I'll call it a SCSI network.

It's fast, and easy to do, and works just the way I need it to.

SAK :)

I was browsing around the different Atari sites though a links list on one site. It's an Atari site that was labled as having "more news than is good for it" or something like that. I scrolled down the list of news and found the mention at the bottom as "Atari Games no more" (the name was cancelled and arcade games that would have been Atari Games are now named Midway) or some such. I wasn't looking for it, just found it.

>digits

It's not the best way, but it's a practical way. It's the method that any scientific calculator that offers an s.d or variance uses because it avoids having to enter the data twice. That is not a problem with a spreadsheet, but in calculating the mean first you would have to take some care with the order in which a spreadsheet recalculates cells.

Your real problem is that you are trying to calculate the variability of numbers which are varying only in the sixth significant digit with what I suspect are 24 bit reals, which are only accurate to 6 or 7 digits. Most spreadsheets provide considerably greater precision.

And if 6 digits represents the limit set on the data by measurement accuracy, then the improvement in numerical precision afforded by subtracting the mean is entirely spurious.

I think you are lumping to much in "software support", I am refering
to CAB specificlly here. You must not use or need SSL? It's kind of
hit or miss, I get odd errors on some sites. It has alot to do with
what you do which makes it appear satisfactory. For me it is not.
Sorry for the sloppy wording, perhaps my fault, but either way
CAB is quite a disappointment. Many times I have to resort
to Lynx just to download a file and that is just one example,
and not even relate to SSL.

All someone has to do is get some of those clones to US shores and then I'll consider supporting them. But I sure doubt THAT will ever happen before the show is completely over.

Hi all,

Once again, thanks for all the input. I decided to go ahead and get Anodyne's ExtenDOS Gold and "CD Writer Suite" (which has 3 programs - audio, backup, and cd-rom). I called Kent at Systems For Tomorrow on Saturday (since that's the only day he is "open"), but no answer. I also sent him an email, then decided to email Anodyne too. EVENTUALLY I'll be up and running. If anyone has any questions about my setup, and how it worked out, let me know.

Only other question I can think of is..... any recommendations on different brands of blank CR-Roms and CDRW media?

Martin, do you know if Look'n'see was ever upgraded beyond 0.95?

I'm asking because I've got an archive of modules for LNS that were released
since that release - and whilst the vast majority work with the earlier
version, one or two apparently use features of a later version.

Peter West (who did the English translation) never had a reply from the author
when he asked about the status of the newer version. Any leads?

I don't think that's right. STGUIDE.INF holds all the path information, that file should lie in your HOME folder. Also hyppath isn't the right spelling for that keyword, if you've copied it from your setup file!

If you are trying to use Makedisk under Windows, it does not work. You need
to run Makedisk from pure DOS.
This will be fixed in Makedisk 2000.

1403. .jpg's of my CT2B Install

Newsgroup: comp.sys.atari.st
Date: 2000-08-06 00:00:00 UTC
From: Brian Hutchinson <bthutch@earthlink.net>
Message-ID: <398D0EA7.BE7D95D4@earthlink.net>
Source record: 58863

Greetings,

I put pictures of my CT2B install at:
http://home.earthlink.net/~bthutch/CT2B_Install/

The Tektronics scope screen shots I took for each of the connections is
at:
http://home.earthlink.net/~bthutch/CT2B_screenshots/

No news to post about my status. Still getting black screen in normal
mode and blue screen in turbo mode.

I guess the good news is I see activity on Address Strobe!

I tried hooking the RF module up to a TV to see if I saw any life and
all I get is a black screen with two horizontal lines that kind of flash
every 2 or 3 seconds.

I followed the latest Fitting.txt instructions from Czuba's Web site.
Things that are different are:
Old CPU is gone
VIDEL gets external clock from clock by DSP
Use of the little Module isn't mentioned. NOTE: In the manual the
length for wires 1 and 2 assume you are going to use the Module. If you
do not use the Module the wires will be too short ... thus the shrink
wrap you see in some of the pictures where I had to extend the wires.

I did use the Module at first since I had it. I took it out and
connected the wires straight to the socket when I noticed the pins push
up and brake traces when I installed it.

Please let me know if you see a mistake I made.

Regards,

Brian

> But... IF! That's the key work. IF!

Who cares about the darn name? It has zero to do with the feel of the
machine! It's a total waste of money to pursue a name.

> "IF" we were able to pull off the revial of the Atari computer division, and
> we made a new system, such as I mentioned in one of my first posts, would
> you buy that system, if you knew it was better than the Milan and fully
> supported by Atari?

First of all, Hasbro was smart to acquire the name and it appears to
be working for them. Any idea of regaining it is moronic. Never gonna
happen. You may as well deal with that concept right now. I already
stated I would by a Hades060 if it was available here in the US. I would
by a Hades over a milan, I know far more satified hades owners. If by
some miracle you build a clone, by the time you get it out the door
how many more users will have moved on? It is a an ever shrinking market
you know.

I don't know how it is in other countries, but here one can get an iMAC
for $800, toss magicmac on it and there you go. Could you realistically
beat this price point and performance? Won't be easy.

> Since the US is where things would start up again, it might take a little
> while to get things over abroad, but I promise you we would do it ASAP. We
> might even have someone there with our vision, start up an Atari division.
> Who knows.

Here's another idea, why not get in contact with Wizztronics? If you
are so determined to have a US based machine, here is another one that
just needs backing, and or funds to get it done. That's to easy a
path to take though?

> I've got ideas for printed ads and cable commercials that just tickle me
> pink with excitement. But we need to start by getting people like Baiz and
> others to join in the team. formulate a plan and execute it with EXTREME
> prejudice... against the Tramiels! :-)

Printed ads and commercials!? Bit premature I think. Did you
buy an ST for $3 at your local GoodWill and then drop some acid?
I think your are on something at this point as others have suggested.

Exactly. There shouldn't be any separator on the vfat "drives" line,
no space, no comma, whatever.

BTW, why not put in "A" as well for vfat? It doesn't hurt and you
don't need to swap drives in case you get lfn's on a floppy.
The only drive I don't use for vfat is C.

I can't fault your visions, but I really don't think that there's the market
for this stuff now. I'm also wondering who these people are who are going to
port their stuff over to this "new GEM"? Most of the German programmers at
least are using Macs with MagiCMac.

>What am I doing wrong?

Use the utility vfat.prg that's included in the MagiC installation.

Note that you can't use it to set drives that you hadn't previously accessed if
you want to use the "temporary" setting - the drive letters are greyed out
unless you'd opened one.

Hi, all.

I've uploaded some info about GSXB to my page (see sig). At the moment this is only useful to Hades owners. As soon as I get the ES1371 driver to work on Milan, I'll upload a Milan version of it. GSXB itself will run on any machine, but that is pointless without any drivers....

Regards,

Odd Skancke - ozk@atari.org - http://assemsoft.atari.org

Clean, original Amiga 1200 with a lot of AGA-enhanced games like Chaos Engine, Theme Park, Frontier etc. No internal HD at present, though may upgrade, and needs 4 of the Workbench disks. Can't think of any reason to use it for anything.

Want a hard disc for my STE, preferably one that lets me keep the sampler connected (No, I don't know how ST HDs work). An SH series would be fine, around 200Mb would be plenty for what I do. A SCSI controller would be equally useful.

Richard

Richard,

If your ST is one of the original batch (no I don't know how to tell) it
could possibly have the
original faulty DMA controller which does not work well with all Hard Drive
adaptors. Not sure
if it possible to get replacement DMA. I did mine myself. What a job.....

Dave.

I have to disagree about CAB. True is it behind the times when it comes to Javascript sites, but for the most part it is does the job and does it well. I can get to every site I want to go to and do everything I need to do. There is support in the Atari platform. I have said it many many times till I am blue in the face. It just looks small when compared to the others, BUT IT IS THERE. If you go and get a Mac or PC, then get MagicMac or MagicPC and you will have a nice system. Just reframe from using that word"stuck" when you talk about Atari computers/clones.

This question is slightly off-topic, but anyway: is this a good way
to calculate a standard deviation, from the numeric point of view?
(I do not question the formal correctness of the formulae).
Seems to me that the above involves subtracting two large numbers
of similar magnitude (close to sum of SQUARES of original numbers)
so that quite a number of significant bits may get lost with the
consequence of getting a meaningless, although formally correct, result.

A little test that I made (finding the standard deviation of 999
numbers, ranging from 1000.02 to 1019.98) obtains only two correct decimal
digits in the result when using the above formulae. An alternative
approach (finding the average first, subtracting it from each value,
squaring the difference... etc.) obtains five correct decimal digits.
This is with "real" type variables, and each method compared to same
calculation performed with "double" type variables as a reference.

Numerical methods are not exactly in my line, so I'm just asking...

I'm still waiting to get my hands on it, but it's specified as such:

4Mb STE
TOS 1.6 and 2.06
1.44HD drive
Fast serial port.

On the whole, I think it will work :) I've been offered an ICD Link2
with a drive, and I think that will be quite suitable - be my first ST
with an HD, too, so I might suddenly find I like it a lot more than I
did my first 520STFM (the early, single-sided drive model).

This TT030 very much has a VME slot.

The prototype Falcon040 developped by Atari, just before their
demise, had 3 slots (or was that 5 - see Curt Vendel's site for a
picture of a salvaged prototype, back and front).

Hey all, I haven't been in the Atari scene in some time (since, oh 93). Is there something different about the Mega STes? I'm pretty sure I had Spectre GCR working and reading/writing to 1.44 floppies with a standard 1040STe. How is the Atari community doing these days? Is it possible to still acquire ST stuff?

Hey Brian,

I looked over your pics and everything looks about like my installation
except for the following.

I did not remove my CPU.
If you cut it off, make sure that no cut pins are touching each other.

Wire 3 is soldered on pin 1 of the socket U63.
Wire 13 is soldered on the tinned hole of the Videl.

Also, I am not using the 32Mhz clock modification for the Videl.
Mine runs off the 50MHZ. (Wire 13 I believe)

I followed the manual that I got with my CT2B. These new modifications
were not available when I installed mine. Thank God!

I believe you said that wire 3 and 13 were cut off of your ribbon cable?

Since yours is not working, this is what I would do.

Try replacing wire 3 and 13 on the ribbon Cable.
Solder wire 3 and 13 as stated above.
Remove the 32mhz clock modification for the Videl.

If you can replace Wire 3 and 13. Then doing this shouldn't be very
hard to do. And you can always reverse this if it doesn't work out.

I think we have the same type of SVGA monitor BTW.

Original CPU is in perfect shape since I used the surface mount IC extractor
from work. I didn't want to mangle the old CPU in case I had to use it
again.

>
>
> Wire 3 is soldered on pin 1 of the socket U63.
> Wire 13 is soldered on the tinned hole of the Videl.

Wire 3 isn't needed since I removed my CPU.
Wire 13 apparently interfered with the DSP clock so the VIDEL clock now
comes form 32MHz clock by the DSP.

>
>
> Also, I am not using the 32Mhz clock modification for the Videl.
> Mine runs off the 50MHZ. (Wire 13 I believe)
>
> I followed the manual that I got with my CT2B. These new modifications

I know. I had reservations about pulling off the CPU. I had one of my
friends at work suck it off for me so it wouldn't be destroyed. I could put
the Falcon back to 100% if I had to. I hope I can get this working or ....

>
>
> I believe you said that wire 3 and 13 were cut off of your ribbon cable?

Yes, cut off right up next to the ribbon cable header.

>
> I think we have the same type of SVGA monitor BTW.

Mine is MAG DX17F. Moved it over to Falcon when I got my Mitsubishi Diamond Pro 900u for my overclocked PC. Was a 300A overclocked to 450. Now I just switched to a 566 overclocked to 876.

Thanks for the info.

Later,

Brian

I am definitely going to buy a Milan II, probably via
a dealer in the UK if it's not available in the US.

>Well if I did not already have a Hades I would buy one (Hades or Milan). <g>
>I think most any good system that would sell at a reasonable price would

>retailers here in the US are not selling the Milan/Hades systems.

The US dealers I've talked to report that they've TRIED,
but the company is concentrating on German distribution.
We need an enthusiastic, zealous importer to break the
log jam.

> AS I
>would love to see true Atari computers being sold here in the US, I will
>admit that clones/emulators are still keeping the Atari name alive. Now
>let's consider that these clones and emulators will not run all Atari
>software.

The big "if" appears to be the "80 MHz" clock speed limit
on the 680x0 processors -- which is why I'm suggesting
"multiples": multiple processors, multiple DSPs, multiple
monitors, multiple ports. This allows the computer owner
to add power and capability to meet their needs. And at
80 MHz, you don't have to worry about excessive power
consumption (i.e., fans as well as restrictions by the
Environmental Protection Agency) which means tighter system
integration / a smaller case.

A net surfer might need one processor and one DSP.

A power user might need four processors and four DSPs.

A visually-impaired individual might need a 2x2 monitor
array (a "video wall"), allowing for a magnified
desktop.

An assembly-line workstation might need four RS-232
ports to integrate four measurement instruments into
a coordinated system. With a little custom coding using
a high-level language like GEM-aware BASIC, of course.

>Maybe a new system that is 100% TOS compatible, upgradable and
>possibly PC compatible would sell here in the US.

I don't know if you've noticed, but "PC Compatibility" is a
myth. Motherboards keep getting changed (anybody notice the
amazing lack of ISA slots in new PC clones?), bios'es keep
getting updated, and vendor support disappears five years
after purchase.

After three years, questionable machines get cannibalized.
After five years, they are jettisonned (with a good tax
writeoff) to schools and charity organizations, where they
might remain usable for another two or three years. In the
PC world, darn few even remember what a "486" was, let alone
use one. Yet, we are still productive on our 68000s purchased
in 1986 (14 years ago!).

And don't forget ... TOS/bios was designed to be "call
compatible" with the IBM/clone bios (that's probably why
extra calls were put in the Xbios). Other calls look
suspeciously like CP/M-68K -- CP/M was the dominant OS
(as well as being very stable and well-understood) on
personal computers before IBM jumped into the market.

And not to forget: GEM was originally designed to run
efficiently on a 4.88 MHz Intel 8088 computer running MS-DOS.
It was also designed for easy portability to other platforms
(the public discussion by Gary Kildall of Digital Research
about "porting GEM to the Mac" attracted the attention of
Apple's lawyers, who quickly put an end to THAT idea as well
as the comapny itself), which is why we've got it on our machines.

So ... at the lower levels, we've got a measure of compatibility.
Plus, we've got an easy-to-port OS and operating environment.
In addition, the OS/environment as it exists was designed for
expansion and future enhancements.

Perhaps it's time to consider what the Amigo team originally
conceived -- an architecture that could be implemented as a
"game machine", a "home computer", and a "business computer".
When Commodore bought the Amigo (later renamed the "Amiga"), it
dropped the "home computer" and the "business computer" from the
design effort and marketed the "game machine" as the home computer.

Maybe we should take a leaf from that notebook.

Design one architecture ... but implement it two ways:
** an unexpandable, cheap Internet appliance (Milan's ad strategy)
** a customizable chassis, with slots and bays (typical desk computer)

Develop both at the same time, heavily marketing the customizable chassis and mentioning the "easy to use, fully compatible appliance" at the end of the presentation/advertisement. This would be very appealing to someone who could translate his/her mastery of one machine to the other, since they are both the "same", inside. They might just buy both of them -- one for "the kids", the other for themselves.

Seeing as that STE has both a TOS upgrade and a serial port upgrade, it's highly unlikely that the DMA will be broken.

Welcome to the world of Atari! :)

Once upon a time <8mkl9q$bb6$1@neptunium.btinternet.com>, Atari Active
<atariactive@btinternet.com> grabbed chalk and scrawled:
>Seeing as that STE has both a TOS upgrade and a serial port upgrade, it's
>highly unlikely that the DMA will be broken.

Well, as I said in email, the original owner was using an.... ICD Link2!
So he's offered to check what drivers I might need for CD-ROMs and such,
as he's had drivers for them.

>Welcome to the world of Atari! :)

Well - welcome to the world of a /good/ 16-bit Atari, and welcome to the
world of using an STE for MIDI :)

It's my first ST/E/. As well as MIDI, I'm really looking forward to
seeing some good demos. Stuff to rival the Megademos I have on my XLs...

People want their TOS computers, right? They want their slots, right? They want it all, right? Well, so do we!

What if (the new Atari) computers were simply modified PCs? You alter the BIOS a little, to allow for an Atari splash screen. You have an Atari ST emulator that boots first, unless you press a certain key to go into GEM2000! And since GEM was originally written for a PC, can you imagine how fast it would run on a Pentium-class (Socket 7 233MMX, mind you) system, not to mention a Pentium II/III, if optimized? Yee-haw!

Sure, you could more or less do that already with a PC today, but assuming anyone cared about the BRANDNAME (unlike most people here, it seems), it still wouldn't be the same.

We would have affordable, already-made PCBs with all the slots you want. We modify drivers to work with GEM for the cards we install and... whoo-hoo! We've got Atari computers again, more affordable than EVER, because parts are already available and cheap!

The only thing we need to do is modify: the BIOS, an Atari ST emulator to work in GEM (or even FreeDOS, if possible), and GEM to work (really fast!) on a Pentium-class computer! In fact, if we played our cards right, people might ACTUALLY be able to run their apps on both the ST emulator and the new GEM! But we HAVE to rewrite as much as possible to optimize it for today's PC environment!

Sure sounds feasible to me and a LOT cheaper than trying to build a custom 060 or PowerPC board, plus modify the emulator and GEM to all that stuff. Not to mention the drivers... oy!

Now see what you clone-people have done? You've taken me from my grand classic Atari ST designs to this altered plan where there's very little difference between a new Atari and a standard PC! All in the interest of finding some way of getting Atari back!

I gotta get some sleep... stuff to dream about! Yeah!

Luposian

I beleive your facts are WRONG. Atari Games is seperate for Atari Corp. Atari Games is alive and well at www.atarigames.com or www.midway.com. Midway makes new games for game consoles and stand alone video games. Have you ever heard of RUSH. Their even making RUSH 2049 which can be found at www.rush2049.com there you will find the latest on this great driving game and some downloadable MP3 files check the first one out. Its called Atari_logo.mp3

As for buying Atari from hasbro that would be a waste of time and a waste of 10-15 million dollars. Ataris name is making them tons of money as well as Ataris old games.

The only way to make sure progs will find their HYP's is be setting the
paths in stguide.inf. e.g. PATHS=H:\HYPERTEX.T\GUIDES

As st-guide is rather old I don't think it looks for its inf in the home dir. I
should say put it on the root of your bootdisk (besides st-guide).

AFAIK the Atari emulator that comes with invers Vertrieb's new Calamus SL 99 or whatever it is, will run cleanly with a lot of other applications.

As usual, the MIDI amd the games are so hardware-dependent that these have a hard time running under such an emulation. :(

But theoretically any old Pentium with the new Calamus package kind of becomes a GEM platform, yes?

Anybody running this system?

I've often wondered if TOS could be ported to the PC as an OS. Right now, one can run emulators (MagicMac, MagicPC, Gemulator, Winston, etc.), but these all require some other OS underneath. I wish Milan (who apparently have the rights to modify TOS) had gone that route, altering and recompiling TOS so that it simply installed on a blank HD and off it went!

Here's another who intends to purchase a Milan II, provided the
OS is in English (which I am assured it is). I would greatly
prefer an English speaking distributor and hope there is at
least one in North America. As for the fuji, I have a few pins
sitting around here -- with a bit of glue it'll have a fuji on
it easily enough!

No, you can't use the emulator that comes with Calamus SL99 window packet
to run other applications. Only Calamus can be used with it. AFAIK, the
emulator (Stemulator) is incorporated inside Calamus.

>

I'm glad to hear everything's working. Just remember...NEVER
access a drive with both computers simultaneously. I realize
it's uncommon for one person to be using two computers at once,
but it does happen.

Don't use MetaDOS but SPIN! and all your problems will be solved.
MetaDOS is simply too old.

>unlucky one who decides to try to make someone happy by writing drivers for
>unsupported hardware.

You get compatibility problems with every new hardware, regardless if it is made by Atari or some add-on-card manufacturer. We had this with the STE, we had this with the TT, and we had this with the falcon.

And in every case, is was badly written programs that disregarded the released programming specs publshed earlier.

Fortunately, these bad programs get less in time. Nearly everything that runs on my TT runs on my Milan as well. When transitioning from 68000 to 68030, I had to throw out a lot more programs.

>was still all-in-one. Why? Simplicity. One set of hardware. Consistant.
>Easy to maintain.

Only as long as you keep the one box.

IMHO, building non-expandable hardware is stupid - people want to add all kind of stuff. There is not market for an all-in-one system - either it can do everything (and is to expensive), or it is too limited.

And BTW: the best thing Atari did was adding slots to MegaST, MegaSTE, TT and Falcon. The bad thing was that they were not compatible, so you needed new extensions for every machine.

>If we were to design a new all-in-one system, we could easily select one of
>the better 2D/3D graphic chipsets (nVidia TNT/TNT2, 3Dfx VooDoo series,
>Matrox G400, etc.). Select a powerful audio chipset. Select a fast CPU
>(40MHz 040 or better). A ton of RAM (32Mb is considered barely usable in a
>PC, but in an Atari? Whoo-hoo! That's like... TONS! Especially with a
>ROM-based OS.

Do you realize how fast such PC-market-based chips get outdated (which means that you can't even buy them anymore, even if you are still happy with the performance)?

You may have your dream, but it seems I (and many others) have a different one.

Anybody had a problem extracting Disk 1? Newsie extracted Disk 2 OK,
but hung on Disk 1 with the message "Decoding August," on the top line
which was a bit strange. After rebooting, I found it had created a
file called "august," with a length of zero bytes.

I've sent off a mail to ROM asking them to send the first email again
in case it got corrupted on the way, but have a nasty feeling it's
going to do the same thing again.

>so perhaps you are the one not listening? I wish you luck though...

Actually, the Milan has two custom chips - only implemented in CPLDs, and
not full-custom design. A current CPLD or FPGA can easily achieve the
complexity of the custom chips in the ST series.

However, a custom chip is no magic black box that performs wonders.
Attaching an existing graphics controller is a lot easier than building your
own, and will get you more performance for the same money (in development
and parts costs), unless you are talking about buying out a company like
NVidia ;-)

I do not know of any parallel port scanners for the Falcon.
Most are SCSI (the Umax Astra 1220S definitely works with ScanX,
the Microtek X6 EL possibly does) and cost about $150 each.
Used Microtek E3 and E6 scanners can be had for as little as $50
on Ebay.

All the MiGraph scanners I've seen (ST and Falcon) connected to
the cartridge port.

The Mega STe is a bit of an unusual ST in that it runs at 16 Mhz
and has a few unique design elements. The Atari community is
small, but it is still possible to acquire ST stuff, and new
software continues to be developed, mostly in the
shareware/freeware arena.

I'm sorry to hear that. It appears that only the 760 has any
DOS/NVDI capability, as noted below. Thankfully, there are
still HPs (bless PCL3!).

Galen

Troubleshooting Tip #0245 for the Epson Stylus Color 760 U.S.
Version. (From Epson America's website)

Printing from Windows 3.1 or DOS

To print using Windows 3.x, DOS applications or from the DOS
prompt, D4 Mode of the parallel interface must be disabled
(OFF).
Take the following steps to set the D4 Mode:

1. Turn on the printer while holding down the Cleaning button.
2. The paper out light will start blinking.
3. Release the Cleaning button and immediately press the
Load/Eject button and hold it for about 20 seconds. 4. The Paper
Out, Color Ink Out and Black Ink Out LED's will light.
5. Release the Load/Eject Button.
6. Press the Cleaning Button and observe the LED conditions as
follows to select the desired D4 Mode:

Paper Out LED - ON = D4 Mode ON
Black Ink Out LED - ON = D4 Mode OFF
Color Ink Out LED - ON = D4 Mode AUTO

NOTE: Be sure to set the D4 Mode to AUTO for Windows 95/98
operation.

Since the human ear can only distinguish pulses of 1/40000 or
1/50000 (depending on the human), recording of better than CD or
DAT quality are of no additional value (for human use, anyway).

Because that would slow up copying to/from A: with Kobold, as it has to
be put in GEMDOS mode to deal with LFNs (only handles it from v3.5 on).
My way A: is copied fast and should I get a floppy with LFNs all I have
to do is to click on the B: icon.

Not at all, although you may spot some odd looking filenames in directories, if you just ignore these you'l be OK, but why would you want to drop back into TOS.

Just in case i'm mis reading this, you have to run under MAGIC to create these VFAT partitions, but once created you can read them from TOS.

Agreed 100%! I'm getting so frustrated (and tired of being frustrated) by increasing numbers of web sites I can't get to because of a lack of either SSL or Javascript compatibility. The state of things web-browser-wise is so horrible on the Atari platform. Is the "Highwire" project still going? It's been a while since I've heard anything about it, and the author's web site has been down for months. I'd love to see someone (especially among the existing web browsers - Wensuite, CAB, or Adamas) make some more productive advances in these areas.

Here's an idea for Jared, why not take his excitement and start
forming a list of US residents and what system(s) they are wanting
and keep this on his page. Then when it reaches considerable
numbers present it to US dealers or the clone makers?

At least route the excitement to something constructive instead
of wasting time trying to re-invent things. ;-)

I won't import anything on my own, would need a partner as two
heads are always better than one. If I imported them myself it
would probably be what I want and not what everyone else would
want or could afford.

1477. Seagate on a TT.

Newsgroup: comp.sys.atari.st
Date: 2000-08-07 00:00:00 UTC
From: Joe Mirando <jmirando@portone.com>
Message-ID: <398F66EE.E264C439@portone.com>
Source record: 58737

Okay guys,

I need some help here. I've got a TT with several assorted SCSI drives attached.

I've recently tried to add a Seagate ST12400N 2 gig drive to the SCSI (not ASCSI) chain and have had nothing but problems. This drive WAS working previously but this time there has been no joy in Mudville.

I can get past bootup and, when running HD Driver (v 7.55, I believe) I can "see" the Seagate as SCSI 1, and can get to the point where I should

be able to format the drive. Here is where the trouble begins....

When I begin to format the drive, it seems to power down and cycle back up again. Of course, by this time HD Driver comes back and tells me that

the media cannot be formatted.

There are several jumpers on the drive that have me scratching my head. Does anyone have any idea of how the following should be set?

Drive Termination

SCSI Parity Check

Write Protect

Spindle Motor Starts On Powerup

Spindle Motor Starts On Command Only

Spindle Motor Delay (ID X 12 sec)

Factory Default - Do Not Alter

TERMPWR supplied by drive to drive

TERMPWR supplied by drive to SCSI pin 26

TERMPWR supplied by to drive and SCSI pin 26

TERMPWR is not connected to drive or SCSI bus

TERMPWR is supplied by SCSI pin 26 to drive

I guess I'm falling behind on the "latest old hardware". <g>

Any help would be greatly appreciated,

Joe Mirando

I'm starting to see how ATARI actually started a platform, and how that platform is slowly filtering into other platforms (aka GEM/Magic).

You have the application for use with the Mac/PC worlds, and then you have the ongoing effort to make "Atari specific" machines, like the clones and so forth.

I think a better vision is to creat another company that programs drivers for
the Hades and Milan for graphic cards, printers, and other add ons.

This could break the NVDI deadlok on the VDI system market control.

They are slow to make support many new items since they have no competion.

You can buy one from Mario Becroft:

http://gem.win.co.nz/mario/hardware/

I think I remember reading about a modification you could do yourself. I think you had to download some code and put it into a PIC but I don't remember where I read this.

If I remember where I read about this do-it-yourself project I'll let you know.

Regards,

Brian

Have you checked fVDI? It's free, works very well and it's easy to write
drivers for it (if you can get documentation on the card that is).

Then again, on MiNT, the sources to the CAB.OVL are available.
Anyone can improve them for better handling of URL redirection
and cleaner SSL support, if they know how to code.

fVDI can already drive several recent graphic cards, is published with source and actively developped. Adding some GDOS printer drivers and TTF drivers would be the next step, but requires more contributors. Johan cannot do everything himself.

I am not aware of any universal absolute right to say anything you like about anyone else. And when someone posts something to a newsgroup we do not have much of an option as to whether we read it or not. There is no warning message saying 'The vast majority of people will find this grossly offensive, only read if you like that sort of thing.' And if he does have a right to post whatever he likes to a newsgroup then I would have thought that I have a right to say 'this is sick' and someone else has a right to complain of it to the ISP. At the _very_ _very_ least it has nothing to do with Atari.

Thank you "Grey Dragon" and Edward, so much! You see, for the longest
time I have wanted to play Sundog again . . . I played in on my 1040ST
back when it first came out, and to this day it is still one of my
favorite games.

So by chance I happened to check in this newsgroup, and lo and behold
you are discussing it! And now I've managed to download a disk image,
and am using it on the WinSTon emulator (currently seems to be the
best ST emulator for Win 9x, and Sundog works in it).

This is great, what a nostalgic moment! Thanks again, so much.

>I remember seeing it once for the PC but I hold no hopes of ever finding

>Does anyone know anything about the Company or the people who programmed or
>worked for the company?
>Interplay was not much help for me as they only provided Dungeon Master 2.
>please help me before I slowly loose my mind. (too late?)

Yeah, I remember when FTL (through Interplay) released Dungeon Master
(another great game for its time) for the PC, I was REALLY hoping
they'd port Sundog to the PC. I wouldn't have cared if they'd done
any enhancements, they could've left it as is! But, alas, it didn't
happen.

I think someone should do a new version of Sundog for today's PCs.
Can you imagine what they could do with this game nowadays? Keep the
storyline and premise the same, but upgrade the interface, graphics,
and sound. Hell, I'd do it myself if I could. :)

Mark,

not that I know of. It's being used and set up by MagiC here. When I
operate TOS the files will show up in 8+3 uppercase.
BTW, you can set up Mint as well to use lfn's. I'm not sure which
configfile but if needed I can look it up.

The one and only reason I use old 8+3 on my C partition is perhaps
some progs might complain about files not being correct. It was all
set up in early days with some old apps still running, therefore I
keep C as the original 8+3 partition. Actually, I never tried setting
it to vfat under MagiC, perhaps one can change it without a single
problem?

CJ,

I have several NEW "TrueMouse" mice available for the Atari system. The TrueMouse is, in my opinion, the best mouse ever for the Atari system. I've been using one myself for years. Price is $27.95, with Priority Mail shipping within the continental United States included.

Also have a NEW Atari Handy Mouse in stock. Its actually its a hand/palm held trackball that can also be mounted on the front of your Atari keyboard if desired. For either left or right handed users with its 3 left mouse switches (one under the trackball itself, and the other two at the 11 o'clock and 1 o'clock positions; the right mouse button is located at the 6 o'clock position. Comes with a 5-1/2 foot cord and top side removable ball locking ring for easy cleaning. Price is $19.95, with Priority Mail shipping within the continental United States included.

Reply in Email if interested.

Sheldon

Hi!

Mark Bedingfield <mark@baypc.com.au> wrote:
> does using vfat afect partitions in singletos in any way?

Some versions of SingleTOS will return the pseudo entries used by VFAT,
depending on what the application uses to retrieve the filenames in a
directory.

Thus, if your desktop (the built-in one is affected) displays rubbish
filenames like Aa with nonsense sizes, you should install HideVFAT,
available from

http://homepages.tu-darmstadt.de/~gryf/software/hvfat_r1.lzh

Ciao

Thomas

Yes but isn't this oversampling due to 1-bit recording?

Basically, all that's needed would be a circuit board(s) and parts
that are not readily available (only high quality stuff though--like an
etched glass/epoxy motherboard)! Add a standard schematic and a Sam's
photofact type booklet (pics of installed, numbered, arrowed parts/test
point voltages, scope pics) with warnings for static sensitive parts,
pregnant and lactating mothers, take before meals with full glass of water,
do not operate heavy machinery..... (:->)~

1513. CD-R Media recommendations

Newsgroup: comp.sys.atari.st

Hi all,

It's me AGAIN - with yet another question. I did include this in one of the followups, but I thought it best to start a new string with this.

Does anyone have any recommendations on brands of CD-R and CD-RW blank media. Any problems with any types or brands?

I'm using a Yamaha 8x4x24 CDRW with all Anodyne software (whenever I can get one of the retailers to take my order! Is everyone on vacation??) on a Falcon with Nemesis, TOS 4.04, ICD utilities.

Thanks for all previous input,

Clayton Murray
Seattle, WA USA

Read where? I'll keep an open mind, but I'm rather skeptical.
Any sound can be defined as a sum of simple sine waves, and
sampling simply marks a series of discrete points that
approximate the waveform. I'm not saying that 2.8 Mhz can't be
done, but I'd be really surprised if this was more than a
marketing gimmick.

Very glad to hear it. Is yours the X6 EL or an older member of
the X6 family?

(Since Microtek hasn't updated its software for the E6/X6 line,
I rather suspect they're all compatible, but I'm not sure of
this.)

My statement was with regards to the Epson Stylus printers currently available in stores. Certainly the old ESC/P and ESC/P2 printers will work. This includes my LQ-800 dot matrix and my brand new 740 (closeout special) as well as your 400. However, the ESC/Raster do not seem to work with NVDI, and that includes the 670 and 760 of which you write. If anyone has an ESC/Raster printer working smoothly with an Atari under NVDI in 720 dpi color, please post!

>David Galvez's question as I understood it was not because his

I agree that David's printer is probably working in graphics mode (if NVDI is enabled, it certainly is). One way to test this is to boot a clean system (bypass the Auto folder and accessories) and attempt to print a text file from the desktop. That is plain ASCII and both my HP500 and HP610CL have no trouble with it (haven't tried the Epson 740 yet).

Annoyingly, after nearly a year of no problems, I killed
Gemulator today.

I installed the Epson 740 driver (I had been using the Epson
ESC/P2 driver) and then discovered Gemulator would not print!
Attempting to change back didn't help, and now Gemulator crashes
upon loading. I'm very surprised at how unstable it's become
over the course of a couple hours, and since Gemulator is
essentially a single .EXE file (no .DLLs or anything), I'm not
sure how to go about fixing it.

From: Jared Falvo <luposian@mailcity.com>
Message-ID: <oU%j5.365$vy3.35893@news.goodnet.com>
Source record: 58656

If you knew Atari Computers was alive again, and that a 68060 or PowerPC system was available for $1,500 or less, would you buy it? If not at that price, what price/features would interest you to buy it? Would an affiliation with Hasbro cause you to doubt the quality or not? And would that doubt cause you not to buy for any reason whatsoever?

It really depends on your player, so it's best to experiment a little bit and see what works for YOU. For example, Memorex has gotten a bad rap in some circles, but I've had excellent luck with it.

I've never had any problem with any brand of CD-R
with any brand of CD-R(W) drive, and I get to try
a lot in my job. You just have to buy some and try
it yourself, this is very simple.

>assemble and sell inexpensive systems to my friends & relatives too! I
>hope the Milan team realizes that doing so would help the "Atari
>community" get revived!

Never mind that, I'm in the UK, would consider buying a Milan II (and
even looking at resale), but no response from their email... So I'm
assuming Milan II will be under ï¿½1,000 basic, which is good if all the
MIDI stuff works as it should and would make me feel a lot happier about
learning about MIDI sequencing and production on an STE.

Slightly OT - how rare are Mega STEs, and how much to they change hands
for, ditto the TT?

Richard (looking forward to his STE setup, but also worried that if I do
learn how to do this well, the STE might just become obsolete and
Falcons are too pricey for what they are, most being upgraded and
towered).

That is great. Make sure you also get CDISO which will allow you to make CD's that will work on any system. Also check the list of CDRW drives that Extendos Gold will work with.

>Only other question I can think of is..... any recommendations on >different brands of blank CR-Roms and CDRW media?

Does not really matter. I got some CDRW CD's by Memorex and they worked great.

I use MultiTOS, but mostly TOS 4.04, which I like. I just wondered if I set up LFN's under another OS would TOS get Tossed off. I burn my own CD's on a PC and always have to be cautious as to keep 8x3. MultiTOS can handle LFN CD's but TOS can't.

Yeah but we are talking hardware emulation not perception, most of the samples I create are 50K, now an emulator would have to be able to play that back, without playing to slow. Not to mention the timming drama's this may cause the software running on the emulator

I guess this says it all about your credibility:

----8<-----
JES>I'm looking for a product called Multiboard, which is a integrated
JES>fastram-card, IDE- and ISA-interface and TOS 2.06-adapter. If you can
JES>supply this or know anyone who can I'll be very grateful.

yes, we supply Multiboards at DM 199,- ... plus handling/shipping ...

with best regards, Konstantin Woller (woller & link gbr, Berlin)

---

http://www.inx.de/w+l

---->8-----

And quite some time later:

----8<-----

JES>Ok, here it is, the regular "I still haven't received any Multiboard"-
JES>mail. Seriously, what's taking you so long?

the delay is'nt cased in our company, we gave the Multiboard by post
long time ago ... now i asked the post for confirmation our delivery,
i'll hope, we'll get the answer soon, but i also now, the post normally
needs long time, to handle these things ... what can we do ?

JES>You have my money, and I
JES>have no Multiboard. It's been almost three months now, the post can't
JES>be *that* slow.

the post can do ... and - believe me - it's not the first time, we had
problems with the post ...

with regards, Konstantin Woller

---
http://www.inx.de/w+l

-----8-----

...and the dispute was settled many moons later when you finally agreed to send me some software instead of the Multiboard.

I saved all the correspondence, and I sent you 16 mails and received an impressive 7... And you still say you answer all your mail? If you don't believe me I'll be happy to mail you the archive, although I'd prefer to post it here...

> JES>> you ordered N.AES 2.0 ??=\ ... and we not delivered it ?????='''

Does anybody else want to comment this?

> JES>> when ? ...
> JES>
> JES>When 2.0 was released, last October IIRC.

> in the last 12 months i really can't remember an email from you ...

Unfortunately I mainly mailed from work then, so I don't have the archives here. But I think I can produce these too in a few days.

> P.S. legalize your copy of N.AES 2.0 ! ...

I'm sorry, but I won't have anything to do with your company any more. Why should I trust you with all the bad experience I have with both Woller & Link and Woller Systeme? You even ignored my requests for the free 1.1.7 -> 1.2.0 upgrade I was entitled to after you shipped 1.1.7 as 1.2. I had to get that version through "alternative channels" as well.

It all depends on what TOS you have!

Just lately I keep hearing about the alt+arrow keys to use the mouse
(home and insert being left and right buttons)! for those that don't
know, by pressing SHIFT as well you get fine movement of the mouse.

Your drive is dying. You need a new one within the next 24h.

This happened to me recently, on my Linux PC. Seems drives of
about 1 to 2 GB from various brands suffer the most of this.

More experimenting has allowed me to get GEMULATOR up and running. It seems to have problems with certain load at start programs. I turned off realplayer and Norton anti virus and it seems to work. I have not tried turning these off individually so it likely is one or the other.

Interestingly on my desktop I could not get success unless I turned ZOOM mode on.

On my laptop it did not work with ZOOM on.

It certainly flies when you get it working.

I don't think that it's only the 760. My 400 works pretty well
too :)
All of the EPSON printers understand either ESC/P2 or ESC/P Raster,
e.g. the 460 and 480 are of the ESC/P Raster type while the 670 and
760 are ESC/P2.
David Galvez's question as I understood it was not because his 460
was not working but because it prints very slow. Here I suspect
that the problem is that the Atari does not tell the printer to
print text even if it's plain b&w ascii text, but it always draws
it as a graphics page (which IS very slow).
BTW I mostly print graphics pages and use IMAGEPRINT, whose printer
driver is definitely better (even if it is still somewhat slow).

Martin-ï¿½ric,

I REALLY didn't want to hear that! <g>

Actually, I have two of these drives. One of them was purchased several weeks ago but not used until now. Neither of them work. That is why I had assumed that it was a configuration problem.

It's funny that you should mention Linux. These drives were to run Linux on the TT. Well actually, ONE was going to run Linux. The other was going to hold NetBSD.

Thanks for the insight,

Joe Mirando

Ah yes, but how did you receive them? If they came via email then
you'd need to extract them from your email program - this is the
problem I'm having. Once they're extracted, you double-click on them
then they unzip themselves.

Not such a problem, subtract the lowest value from each of the data, calculate
the mean & s.d. of the residues. You can then add the mean calculated to the
lowest value to give the mean of the group. The s.d. is the same for each ie.
the original data or differences.

If Jared doesn't, somebody ought to. That's a great idea! Just think how pumped up that dealer would be to have a list of buyers without having to advertise or anything! That would give them incentive to sell it, too.

Hmmm... sounds like fun. Too bad I'm so fricking busy already! I'm sure somebody in here would partner up with you if you wanted.

That's a great idea! It would cost Milan computers less money to ship them out, and they probably aren't making much profit on all those accessories anyway (diskette drives, hard drives, cases, etc.). If they do that, I could easily see them selling more kits than complete systems! Nearly everyone has (or has access to) spare parts, right?

I'm always looking for Atari stuff, and I've never come across a Mega STE for sale locally. I've never even seen one except for pictures on the net. Same with the TT; it's even more rare over here. Or maybe I'm just not in the right places at the right times. Almost all the Atari computers I see are the 1040STF models. Once in a while I'll see an STE. As for prices, I'd say a Mega STE would go for between $200 and $350, depending on what comes with it. The TT probably would be $300 to $600. The trick is finding those systems over here!

Figures...

>Once in a while I'll see an
>STE.

I have a 4Mb upgraded STE, I'll have it in my hands tomorrow :) I'm just
planning ahead...

>As for prices, I'd say a Mega STE would go for between $200 and
>$350, depending on what comes with it.

Sooo, around ï¿½140-ï¿½250. I could deal with that if the STE really does
help me with music.

>The TT probably would be $300 to
>$600. The trick is finding those systems over here!

I don't really know all that much about the TT, to be honest. Again, the
bottom end is tolerable, given a TT /should/ be able to to HD recording
- however, the Falcon030 definitely does HD recording and seems to go
for ï¿½200 - ï¿½400 depending on upgrades.

I could import from Germany, being based in the UK :)

>I don't think that's right. STGUIDE.INF holds all the path information, that
>file should lie in your HOME folder. Also hyppath isn't the right spelling for
>that keyword, if you've copied it from your setup file!

Yes I know STGUIDE.INF holds path info *for ST-GUIDE*, but this is for
the unpacking of the Smurf disk which may not access this. Olaf sent me:
'C:/ST-GUIDE/GUIDES wird nicht gepr�ft, nur C:/GUIDES. Au�erdem wird aber
die Environmentvariable HYPPATH gepr�ft. Du kannst mal versuchen, diese
auf Deinen Guides-Pfad zu setzen (HYPPATH = C:\ST-GUIDE\GUIDES), das
sollte funktionieren.'
Or in English: 'No check is made for C:/ST-GUIDE/GUIDES, only C:/GUIDES.
But in addition the environmental variable HYPPATH is checked. You can
try to set this to your Guides path (HYPPATH = C:\ST-GUIDE\GUIDES), that
ought to work.'
He doesn't make it clear which env variable, but I assume he means the
MagiC one (though he has written it with spaces either side of '='). I
have asked him but no reply yet.

Since then you may have seen that Charles Stanley has taken a look in
Edhack at the archive and didn't find a SMURF.HYP in it - so perhaps
it's been left out.

>
>As st-guide is rather old I don't think it looks for its inf in the home dir. I
>should say put it on the root of your bootdisk (besides st-guide).

Sorry but you've missed the point of my question. It's not about a program not finding its HYP file (I know a bit about that as I translated much of ST-Guide in the first place) but about Smurf not unpacking the HYP file from its installation archive - I presumed because it doesn't know where to put it. But Charles Stanley has looked into the file with EdHack and the HYP doesn't seem to be there. And having taken a look with Egale, I can now confirm that.

> I think it was Epson.

I have GT Look 2, but I don't remember an option to use the cartridge port. I know I don't have a cartridge to plug in. I know there are 4 port options for collecting data, one is SCSI, one is parallel (printer), but I don't remember the other two. The software is on my Hades, which is in the middle of moving from point A to point B, so I can't go boot it up and find out.

The software does use the Epson scanner. I have the ES 800, which had a different model number in Europe.

Migraph's Colorburst uses a combo cartridge and parallel port cabling for the TT version, and uses TT low res.

1588. Falcon woes

Newsgroup: comp.sys.atari.st
Date: 2000-08-09 00:00:00 UTC
From: Ken Springer <wordworks@greeleynet.com>
Message-ID: <3991567E.92402F4E@greeleynet.com>
Source record: 58597

I recently had a chance to sell my Falcon, so I hooked it up
for the first time in 3 years to make sure it would work
ok. It didn't. :-(

Two problems:

It does not recognized the floppy disk.

The mouse cursor will not move to the right, just up, down,
and left. The mouse itself is not the problem, as a known
good mouse also does not work.

Any suggestions? I have no idea where my nearest Atari
service might be.

Thanks.

Ken

1589. I, was born, under a wandering, mouse...

Message-ID: <GZOXQUGfyVk5Ewto@lovecraft.demon.co.uk>
Source record: 58598

Weird behaviour... I got my STE today, and hooked it all up - it looks messy, but it works, and an XC12 kindly donated screws to hold it together properly ;)

It has an aftermarket mouse.

This mouse likes to wander. Usually to the left of the screen, sometimes to the right. Messing with the connector on an extension lead can fix or exacerbate the problem.

I'm thinking years of being removed by the cable have broken some wires?

Anyone want to sell/give me a real ST mouse? I happen to like them, I could even use a couple so I have one for my XLs...

Other problems - the spacebar appears to be missing a spring. Am I right in remembering the best fix for this was to nick the spring from the right-shift key? Or can I mutilate my 65XE and steal a spring from that?

Other than that, it's great :) TOS 2.06 and Rainbow TOS (the logo changes colour), 4Mb RAM, HD floppy, HD external floppy (with a blown voltage regulator), sampler, realtime clock[1], monitor switcher, all for ï¿½40 plus the shipping :)

Richard
[1] Ah, yes. The clock. It doesn't work, it has a battery in it which I think is dead. It's an FMC-II, and the software doesn't let you set dates beyond 1999 ;). Can I either get new software, or a different external clock cart that does support dates beyond Y2K? I'm guessing replacing the battery will fix the cart.

Hi all,

I work for a game sales/rentals shop and the boss has just decided to shift the piles of Spectrum/Atari/Amiga/MegaDrive/Snes/Master System/Commodore etc items that he has piled up in the attic.

We have literally boxes of games available with a considerable bulk discount available. We also have bits of hardware available (some machines, PSUs, printers etc).

If there is anything you are interested in please do not hesitate to let me know.

Cheers,

Ben (the corporate tart)

On behalf of Computoz (www.computoz.co.uk)
btw we do have some lists available of clearance items available thru our website.

Are you doing marketing research for you or the Milan folks?

With that said. I would still buy an Atari due to my large investment in
Atari software. Moving to another platform for me would mean paying about 3
times more in software than the cost of a PowerPC.

However:

Have you ever taken a look at the Atari clones.
They are not best on PC boards but custom design systems.

Hades by Medusa Computer Systems: http://www.kingx.com/kingx/medusa/
Milan by Milan Computer GmbH: http://www.milan-computer.de/

If you could out do these computers with great driver for Voodoo, Matrox,
Diamond Viper and ATI Pro Rage in PCI, ISA, AGPx graphic cards. Support
USB, Firewire, and SCSI-3. Support SoundBlaster, Creative 3D, Diamond in
PCI sond cards.

Do all this and be backward supportive of all of the ST, STE, TT and Falcon
software.

You would have an Atari ready for the new real world.

Best of all YOU will have do what Atari never did.

The best I would like is support for current graphic and sound cards on
the existing Atari clones.

A couple of Mac computers at my workplace were fitted with a card which added a Pentium PC to it. It had the processor, RAM, BIOS, and perhaps more included... the PC side used a partition on the Mac's hard drive and used software that (1) allowed you to switch between the Mac and PC using a combination of keys like Alt-Enter, and (2) allowed you to put files in a shared folder in order to transfer files between the two platforms. Both motherboards used the same floppy, hard drive, network card (i think), sound, video, etc. When you switched from the Mac to the PC, the Mac would stay on, but just sitting. Sometimes I'd go back and the screen saver was on...

If a PC can be added to a Mac via PCI slots, why couldn't we do the same with, say, a Milan? I don't see why not. Milans use regular PC/Mac hardware anyway.

What do you think?

2.06.

Looks to me, the EASIEST way is to buy the IDE interface from Mario Becroft.
It is a snap-in deal (I guess), and gives you the more modern TOS as well as
the ability to use IDE drives.

Mario has had this available for a while, and others are distributing it.
Haven't really heard much back on how well it works, how easy it is to install,
etc.

That's the same Seagate I've got. It's dead, I'm afraid. Quite disturbing, since I have _2_ of
them. Is that what they mean by "double indemnity"? <G>

I've tried both drives both in a chain with all my other drives (2 CD-ROMs, 230 meg SyQuest,
100 meg ZIP), and with nothing but the internal HD, and with different IDs. Same result, no matter what.

> Another perhaps peculiarity is that when I power up, I hear the

Thanks Louis!

I'm on my way now.

I've just ordered a rebuilt Seagate 3.2 gig MONSTER.... it's a 5.25"
FULL HEIGHT drive. If nothing else, I can use it as a boat anchor. <G>

Thanks again,

Joe Mirando

It's unfortunately not available for download yet, but will be soon.
We've just sent a beta-version to one of our testers, and if that goes
well, it'll be up on our page shortly after. There are just some small
"cosmetical" bugs that need fixing. NatFrame works alright as it is now,
it's just not so pretty as we would like it to be.

Hi,

> Two problems:
>
> It does not recognized the floppy disk.

Check the connections between the drive and the PCB. Also, check the
PSU:s output voltages.

> The mouse cursor will not move to the right, just up, down,
> and left. The mouse itself is not the problem, as a known
> good mouse also does not work.

It may be a broken soldering on the mouse connector. Another possibility
would be if the 74LS244 on the keyboard is broken.
Go to my site - the troubleshooting page, to find other hints - as well
as a link to a source for schematics...

Could also be a broken soldering on the mouse connector on the keyboard PCB - or the 74LS244.

> Other problems - the spacebar appears to be missing a spring. Am I
right
> in remembering the best fix for this was to nick the spring from the

that?

Did you open the keyboard and find that two of the plastic pieces were missing? Two should be missing since there are doubled spaces for those plastic pieces, so check which ones you placed wrong when you re-assembled it...

> utilities.

Hi,
I have the same burner and like it a lot :)
I've used a couple of different burners during the years, but I've never experienced problems with other than the cheapest noname-CDR's, but even with them, it works most of the time. However, the cheapest disks often give you trouble when you want to replay audio-CD's in an audio CD-player - nad there may be problems when trying to burn at higher speeds than 4X.
Keep to the well-known brands - but try others every once in a while - you may find a noname-"brand" that works very well.
For the moment, I use mostly Kodak and I haven't had any problems burning at 8X on my PC. The Falcon is another story since it can't handle the data quickly enough for 8X... :(

This is not true. There are several differences between 1.1.7 and
1.2.0. I know, I have all versions on my TT (for testing purposes).

> and also we emailed the 'finished' version to all for free ...

Also not true. I never received it even though I mailed you several times
about it. IIRC I got one mail from you where you stated that the upgrade
will be sent for free - I never received it.

> and, as i remember, Frank Naumann contacted me for your update ?:' ...

I asked him to do this, as you never replied to my mail. Nothing happened
after his request either.

> i'm sorry, at this point i can't see any reason to use
> a pirated copy of N.AES 2.0 ...

That's because you're not me ;-) I'll be happy to pay for the upgrade -
but I just don't deal with German companies anymore. Get some UK or
Scandinavian dealers.

Btw. I paid full price for both 1.1.0 and 1.1.7, so I've already paid
2.0.0 partially...

My MiGraph monochrome hand scanner for the ST was a cartridge port and I remember noting that the MiGraph "wand" scanner (a hybrid hand/flatbed) scanner for the Falcon was to be cartridge based. I never actually bought one, so they might have changed their minds.

I thought the Migraph color hand scanner for the Falcon was cartridge also, but I'm apparently wrong on this. My apologies.

Hi :)

>Could also be a broken soldering on the mouse connector on the keyboard
>PCB - or the 74LS244.

Definitely the mouse.

Using extension lead, mouse behaves just the same - no tension on lead at keyboard end. At plug end, where mouse lead is encased by the stress-relief part of the plug, move it around, and the mouse works. Sometimes, moving this part of the lead can make the pointer move!

>Did you open the keyboard and find that two of the plastic pieces were
>missing? Two should be missing since there are doubled spaces for those
>plastic pieces, so check which ones you placed wrong when you
>re-assembled it...

I hadn't been into the keyboard - when I powered the machine up, it was going pingpingping ;)

I took the keyboard apart, and remembered - the springs on my first ST were an aftermarket upgrade that I fitted! This doesn't have any springs. What it did have, was one of the little cups underneath the space bar had perished and split, then the contact pad had got trapped so close to the PCB that it was almost touching - the weight of the spacebar pushed it down.

I swapped the cup for the one in the left-shift key, and it's all working again now.

>But there is no Epson Stylus printer, even not the 480 which
>just appeared a few weeks ago here in Europe, which doesn't
>offer either ESC/P or ESC/P2 emulation.

Not true (at least for ESC/P2). From the Epson America website:

"The Stylus Color 300/400/440/640/660 and Stylus Photo series inkjet printers are not DOS compatible. Unlike other EPSON models, they are designed primarily for Windows therefore will not accept printer ESC codes. These Stylus Color printers use ESC/P Raster language and the LQ models use ESC/P2. The difference in the languages prevents the printers from emulating the LQ or any other models."

>I'm not sure what you mean when you say that ESC/Raster doesn't
>work with NVDI.

I'm not completely convinced of this yet, but the data is leaning that way. ESC/P Raster (to use its entire name) is incompatible with ESC/P2, which NVDI supports well. I SUSPECT that NVDI does not support ESC/P Raster completely based on the comments I've been reading. Are you saying that YOU use an ESC/Raster printer and it works with NVDI in 720dpi mode? I'd be delighted to be wrong about this.

What I THINK is occurring is that ESC/P Raster is a superset of ESC/P but not of ESC/P2. If this is correct, 360 dpi color should be possible, but not 720.

>IIRC I read something in the EPSON printer manual about holding
>down the 'droplets' key while switching the printer on to put it
>in emulation mode if you have no appropriate printer driver but
>I never tried it.

I would be interested in that information if you can dig it up. There is something called a "D4" mode that I've posted here, but I have no printer that uses it.

By the way, I spent a bit of time looking pictures of the 480 printer. No buttons at all on the outside that I can see?!!

I personally wouldn't mind having such a card, especially if one could buy, say, an Eclipse with an extra empty PCI slot, get appropriate drivers, and use it on a Falcon, as well as a Milan. It would be a God-send to those of us with limited deskspace (i.e. no room for a second computer). Although I'm sure there are some technical difficulties with such a project.

I have a Techno Plus Mouse which shows the same symptons. Kellis told
me what the problem is.

The mouse is not light-proof. 50hz pulses from the room light get in.
If I hold my my hand over the mouse without touching it when the
pointer goes for a walk, the pointer stops.

>price, what price/features would interest you to buy it?

The cheaper the better for a base machine... then would be nice
to have to possibility to add more stuff like DSP cards and MIDI.

Would
an
>affiliation with Hasbro cause you to doubt the quality or not?

Wouldn't make any difference.

And would
>that doubt cause you not to buy for any reason whatsoever?

No.

I think the Milan II can be a good option if it makes it across
the atlantic. Medusa haven't given much signs of life for a
while, so I don't think is a viable alternative by now.

My advice if you really want to have an US-made Atari clone, is
to import the Milan II and then register as a developer. This way
all improvements can be made, but without diverging into
different machines.

Geez, Jared, it seems to me no one actually answered your question. :-/ All they could do was tell you what to put in it or complain. I don't know what your plans or ideas are, but with this type of response, I'd quit now rather than try to develop such a machine.

People, all Jared wants to know is if there is any interest in buying such a machine. If there's no interest in buying an up to date Atari computer, why bother putting in the time to design one?? It looks like a basic "yes" or "no" question to me. Either you are interested in buying a new Atari, or you are not. Simple as that.

People sure get nasty and picky in this newsgroup anymore. What has happened to the old spirit of helpfulness that used to exist for Atari users?

That said, in answer to your question, if it were a 68060 the answer is no, I would not. Too slow by today's standards. I'm used to a 400 mhz Pentium now, and the slowness of my Hades with an 060 is frustrating to me.

With a PowerPC, it would depend on the bundled software and speed, basically. It would have to be better than what is available in the PC World, because to make the idea a success, you will have to be able to convince those users to swap platforms and buy and learn something different. Linux seems to be making some headway in this area as I am seeing more and more software for that OS in the stores. Corel has a version of Word Perfect out there for Linux, and although I've not seen the current Windows or Linux version of Word Perfect, I'd bet they look and work very similar, and probably file compatible to as great an extent as possible.

Killer software would have to be bundled. The best of what exists today improved to an extent that it blows away stuff

bundled on the competition, and much easier to figure out how to use. Although I am at a loss to know how make a program both powerful and very simple to learn. I don't think it's possible.

And I wouldn't buy it immediately. It would probably end up being my next purchase, and who knows when that would be?

Ken

He said it himself he had 2 kids a wife and no money, so
where does that leave the idea? Wait for him to hit
the lottery? It sounded like a pipe dream from the get go.

What bothers me is someone
coming in here without first reading up on the simplest
of things... my replies were probably nasty but one can
take only so much. Especially when you give them the info,
point to a place to get the info and yet don't seem to
grasp the situation. I think getting everybody at least
to an 060 is a reasonable plan, but thru the current
clone makers... if they don't sell anything they will
vanish. It seems even simplier, just get the milan and
such over here, and by selling 060's they can fund further
development on PPC. Not everyone could plop down the cash
for a PPC right off the bat anyway. An 060 is freaking fast

in relation to what Atari users are used to. I seen one
and it was stunning how fast it went.

>time to puzzle it out at the moment. I guess I'm going to just put them aside for

Spindle drive motor should be on all the time the drive is powered

Parity should be off

TERMPWR should be set to power the internal drive AND the external bus (pin 26)
(actually, this doesn't matter too much as long as another drive on the bus is
supplying this voltage)

Termination on the TT is a thorny one described at length recently in this
newsgroup.

HTH.

Show off!!.

So where is the public support gone?. BTW, i managed to find out the problem
with the "Special Options" button in the print dialog, albeit in the demo ver.,
i understand you had the same prb with the full version, but anyway, its a
problem with the binary, easily sorted as well.

Hello Shiuming.
I don't think you have to worry on that area. For people to create this
sort of humour would only laugh louder at their closest relatives. The best method
of retaliation is to question the joke in front of them. They end up confused by your
reaction and stagger.
proverb:
if a man creates bad humour
he will smell of bad oder to
his friends.

Basically, all that's needed would be a circuit board(s) and parts
that are not readily available (only high quality stuff though--like an
etched glass/epoxy motherboard)! Add a standard schematic and a Sam's
photofact type booklet (pics of installed, numbered, arrowed parts/test
point voltages, scope pics) with warnings for static sensitive parts,
pregnant and lactating mothers, take before meals with full glass of water,
do not operate heavy machinery..... (:->)~

John,

Thanks for the reply.

The SCSI line is okay... everything else works, and the power supply is putting out voltage well within tolerance.

I've tried having just this drive and the internal drive attached. Still the same symptoms.

The internal drive is SCSI ID 0, the "dead" drive is SCSI ID 1.... although I've tried all the other available IDs as well.

I'm hoping that it's just that I've got a jumper set incorrectly, but I don't have the time to puzzle it out at the moment. I guess I'm going to just put them aside for now and scrounge for a replacement.

I guess that Linux and NetBSD will have to wait a few more days. :(

Thanks again,

Joe Mirando

>price, what price/features would interest you to buy it?

PowerPC with a few PCI slots, expandable memory, USB, etc., the usual
common peecee attributes, plus native TOS in ROM (or Flash, rather)
and (mostly) compatible with ST software? At that price? Certainly!
But I would have to have very good evidence that it was more than
vapourware.

>Would an
>affiliation with Hasbro cause you to doubt the quality or not? And would
>that doubt cause you not to buy for any reason whatsoever?

I can't see how an affiliation with Hasbro would be any grounds for
doubt for the quality of such a machine. Again, the evidence for this
affiliation would have to be very good.

But there is no Epson Stylus printer, even not the 480 which just
appeared a few weeks ago here in Europe, which doesn't offer either
ESC/P or ESC/P2 emulation. I'm not sure what you mean when you say
that ESC/Raster doesn't work with NVDI. I can only say that I had
troubles at first when I tried printing Papyrus 6 documents via
NVDI but I think they were solved by upgrading to NVDI 5.02.
I don't remember the resolution but it probably was 360 dpi and
I remember it was a mixture of text and some pictures (that means
some colors were in it too).
When I'm making CD covers or labels I always use 720 dpi color
but not via NVDI but via the built in printer driver of IMAGECOPY
since I need exact positioning on the paper which IMAGECOPY offers.

IIRC I read something in the EPSON printer manual about holding
down the 'droplets' key while switching the printer on to put it
in emulation mode if you have no appropriate printer driver but I

never tried it.

Hi

Is there an easy way to ROM upgrade an Atari ST1040 FM from v1.04 to
2.05? The Atari board is REV. D.
I have the two v2.05 eproms, but the old v1.04 Eproms fits in 6
sockets!

Hopefully somebody has performed this operation.

Like Edward, I had no problem with mine. I downloaded the mails with Popwatch and decoded them in Okami. No problem with the self-extracting either.

I wonder if Ulli realised the problem and Edward and myself got them after you ?

Either way, there is a good version out there, so hopefully you'll get it soon.

Cheers

Paul

>I guess that Linux and NetBSD will have to wait a few more days. :(

Joe,

I lost track of the original msg yesterday with the type of drive, I
only recall it was a 2 gig Seagate...
I operate one Seagate ST12400N here together with two Quantum
Trailblazers of 850 meg each on my TT. Drive ID here is 3, I have no
jumpers set except for the ID switches.
Only setting perhaps in HDDriver here is SCSI Initiator set to ID 7.
I got it from a mainframe surplus, being delivered as a 1 gig drive.
It then had one partition of 1 gig, I repartitioned into one 300 MB,
one 865 Mb and one 883 Mb totalling into 2048 Mb. Never experienced
any problem in repartitioning/formating.
BTW, behind the Seagate is my CD-ROM, ID4 and terminated.
One Quantum, the Seagate, the Syquest and the CD-ROM are housed and
fed in/from a separate PC tower.

Another perhaps peculiarity is that when I power up, I hear the
Seagate spin up, then kinda spin down again. It works flawless,
nevertheless.

Perhaps your drive just entered the last hour of the MTBF-value? <G>
(sorry, couldn't resist)

24/96 can be had very cheap. It's all in semiconductors.

>Since the human ear can only distinguish pulses of 1/40000 or
>1/50000 (depending on the human), recording of better than CD or
>DAT quality are of no additional value (for human use, anyway).

Have you seen/heard the new SACD (Super Audio CD) format?
2.8 *MHz* sample rate. It's not about distinguishing the pulses,
but how those pulses ultimately affect the quality of the
continuous output signal. The effect of a lower sample rate is
heard as a drop in HF response, not individually distinguishable
"pulses" - as you only hear as much as the system can record (in
this case, LF information). Just because human perception can't
detect isolated acoustic energy above 20 KHz, doesn't mean it
isn't there and doesn't have an effect on audible frequencies.
Wave interference generates harmonics, the basis of the character
of sound and music. Due to similar principles, you don't get a
sun tan by sitting under a light bulb.

No. 2.05 only runs on STE, you need 2.06 (plus a GAL for the modified
address decoding).

Graham,

The Atari MegaFile units do NOT use a SCSI or IDE drive mechanism. Your best bet, if you want to use a SCSI device, would be to simply mount the drive into a standard external SCSI case and find an ICD Link or Link2 interface to connect it to your Atari system. I've seen used ones for sale from time to time here in this newsgroup.

Please stop cross-posting this thread to every atari newsgroup.

Since you are talking about some souped up ST clone, post only to
the comp.sys.atari.st newsgroup, in the future.

Otherwise, if you still wanna pursue the "with the Atari logo on
it" crusade, use comp.sys.atari.advocacy, instead.

If you are gonna insist upon caling it american-made, instead of
having a global perspective, please use alt.buy.american.

In any case, stop poluting the newsgroup with your nonsense.

If you really want to revive the platform, start by visiting
every page referenced on:

Hallvard's Launchpad http://atari.nvg.org/launchpad/index.html
The Atari Webring http://www.webring.org/cgi-bin/webring?ring=atari;list

In other words, do your homeworks first and research the current
market, if you wanna be taken seriously.

Hmmm..I've never seen a scanner that works on the Falcon cartridge
port. Do you remember which one does?

I do have the MiGraph ColorBurst handheld scanner and it does connect
to the Falcons Parallel port. Also have a Golden Image Hand Held that
works on the ST/STE thru the Cart port, but won't on the Falcon.

Also, There is the GT Look 2 Software that worked with a color FlatBed
scanner thru the cart port. Not sure on the scanner name though. But
I think it was Epson.

Lattice Semiconductor, GAL16v8 or PALCE16v8

However, this will not help you much, since this is a programmable device:
you need to burn the correct logic equations into the device before it
starts working as you need - you need an address decoder for the range
$E00000-$E7ffff, and gererate DTACK for the CPU for that are.

Hi Chris

May I be so bold as to suggest MyMail? If you have a newer AES it is a
great program. If one gets a mail with attachments they appear as
icons in below the main mailwindow and then it's just a case of drag
and drop or as I do most of the time, doubleclick and ST-Zip is
started and the file sent there. Work's great!

That means that I can't use them on my 8Bit Atari. But the ST should
be a different story (at least with NVDI 5).

As I said I'm using the 400, which is ESC/P Raster as can be seen
in your quote above, to print 720 dpi color pictures. The only
thing I'm not sure about is whether NVDI supports all possibilities.
BTW if you want something to be checked on the 400 I can do that
for you in the next days (but not later since I'll be throwing
away the 400 next weekend since I bought a 760, which is ESC/P2,
yesterday).

From: Jo Even Skarstein <joska@nvg.ntnu.no>
Message-ID: <8mudfd$7pg$1@snipp.uninett.no>
Source record: 58500

I'm looking for a colour graphics card for my TT, preferably a Nova with
Mach 64. ET4000-cards will also do. I can either buy it, or trade it for
one or more of these items:

1x Nova graphics card for the Falcon, Mach 64, 1Mb. In excellent
condition, I've used it for two years without any problems.
1x Matrix M128 VME graphics card. This is a monochrome card, I have not
been able to test it as my monitor can't handle it's resolutions.
1x BioData VME ethernet-card with MiNT-Net driver.

> building a complete computer.
>

Oops, that's what I meant. If they can put a Pentium processor &
memory on a PCI-card and use it in a Mac, we could put a 060, ROM, RAM,
etc. on one and use it in a Mac or PC!

Looking at the box to one of these PC Compatibility Cards, the features
include:

~256k level 2 cache w/ integrated FPU
~16mb RAM (up to 80)
~2mb of graphics accelerated video DRAM using ATI mach64 video chipset
w/ software MPEG
~Creative Labs Sound Blaster 16 sound output
~Built-in Ethernet networking
~game port

The package contained:
~The card (duh)
~external PC video loop back cable
~sound cables

I wonder if Milan would take this project on? Who else would possibly
do it? Mario, where are you?

Hello,

in article <8mu6plqpq1@hermes.achilles.net> (comp.sys.atari.st)
Mark Friedman wrote on Thu 10-08-2000 12:22 (GMT):

> Hello there, was there ever a discussion here about a Y2k patch
> for XBoot? Now that it is 2000 it still works but I can't create
> a new set or rename an old one. I can change sets, but I can't
> rename them.

You may set you system date ie. back in 1999, do what changes you need,
then set back the date to the good one.

Bye,
/Pascal/

The TT was a GREAT machine. PC's were far behind, and the Macintosh was no-where near in speed and performance. Now if only more people knew that at the time.... ;)

> I didn't leave the brand, the brand left me, and you cannot bring
> Atari back to where it was 10 years ago. You might be able to buy

I think the name gets passed on. From Bushnel, to Warner, to the Tremmels, to JTS, to Hasbro. Who is Atari?

> Commercial pressure killed Atari. Do you remember how popular the
> gramaphone record was? Far more popular than Atari. Do you think

But like a gramaphone record... still fun to play and collect!

Bring it back... hmmm.. if well marketed perhaps as a collectors item of nostalgia. I think Hasbro is doing just that.

Yes, that is what I use also. Mymail extracts the attachments to a folder
where I can get to them. For quicker access I have the folder on my
desktop. A problem comes when someone uses the UUE format instead of MIME.
If this happens I just forward the message to myself and use Newsie
instead.

If I could get my hands on a PowerPC Atari computer, I would buy it no
matter what the price and where the company was based. I would not care if
it was affilated with Hasbro or not. I think more people would buy it if it
was connected with Hasbro since it is a solid company.

I think that would be great. It is possible to do that. All that is needed
is the drivers. When I bought my Hades there were two Pentium PCI cards
that had drivers that were being worked on. The project was scraped because
of the cost of the card. To me, I would have loved it as I wanted to play
the great RPG PC games on my hades.

Please allow me to reword my thoughts....

I want a Milan-on-a-PCI-card that I can stuff into my PC. Then I can have a Milan without having to buy all new drives, etc. Plus it will save desktop space. Plus it will cost less. I think it would be a hit!

If they could put a PC-on-a-PCI-card into a Mac, we could put a Milan into a Mac or PC, too! We just need somebody to manufacture it!

See what I mean?

There exist a patch for Xboot but it works only for some xboot versions.
xboot exist in at least two versions. One 91.630 bytes and one of 58KB.
Only the 91.630 version can be patched.
The 58Kb version is an auto extracting program. There
exist also a program to unpack it but it never worked for me.
Unfortunately I don't know the URL for both programs.
I do have the unpacker on my HD. It's called naughty.prg.
Interested?

>Javascript?

Not good at all. Sure some pages can be accessed but the most are
unreachable. The worst is that when javascript is enabled and you run into
trouble Adamas will block the whole system. You can try to kill Adams but
the next time you launch Adamas again it will provoke a nasty system
crash.

Yesterday I used Adamas because even though the pages I wanted to view
with Cab didn't contain javascript I couldn't see then as htm, only as
plain ASCII.
At first I didn't had a problem with Adamas but when I clicked on the
return buttom I only got an empty page. It seems Adamas has severe trouble
with the cache.

Ok, so change the cable; that should be quite easy. If you are not skilled with this, I suppose a friend can make it for you- using a D-9 connector and a piece of 8-wire flexible cable. Preferably it should have the same diameter as old one, so the stress-reliefing ends from the old cable can be put on the new one.

As a (better) alternative, the wires can probably be pulled out from the outer hose of the old cable, and you can replace them with thin teflon-coated wires. If you leave some slack at both ends (in the connector and in the mouse) this cable will be less prone to twisting and straining than the original one, as the teflon wires are very slippery and the cable will be quite pliable. A mouse with a cable repaired like this has been working for me for several years without any further trouble.

Btw. it seems to me that cable failure is maybe a main cause for malfunction of many a computer mouse. Those cables simply can't stand what is required of them.

>etc. on one and use it in a Mac or PC!

It seems that the bright ideas about how a hypothetical new atari-compatible computer should look alike slowly drift towards just two items:
1) hardware-wise, it should have all the capabilities (slots, interfaces, cards, etc. etc) that a PC have;
2) Software-wise, it should run TOS-compatible (for want of a better word) applications.

But then, the hardware component, PC-like, already exists, at unbeatably low prices- it's the PC itself.

So only the software aspect remains. And I think it can be solved in software-only much more effectively than by special cards. There are a couple of Atari emulators that are quite reliable and compatible and run at considerable speed (MagicPC/Mac, TOSBox, Gemulator...). Yet they all need an operating system (DOS,Windows...).

But it need not be so. Theoretically, a software "emulator" which would, in fact, be a complete OS, something like TOS/GEM-for-Intel-CPU can be developed, to take full advantage of all hardware resources, and not be burdened by compatibility with Windows-to-Windows-to-DOS, etc.

Such a creation would need just the machine's BIOS from ROM (maybe only for booting?), and then it would be on its own. With the speeds of relatively cheap CPUs approaching 1GHz range, such an "emulator" might fool any atari Application that it is running on a very fast 680X0. The current Atari emulators have a ratio of real (Intel) vs. emulated (Motorola) clock speeds of about 10:1, so I suppose the "emulated" speed might be somewhere in the 50-100MHz range- which is no worse and maybe better than Milan can offer, and may get even better if/when faster CPUs become available (which will never happen again to 680X0).

I know that it is an enormous effort to practically make a complete OS, but it is much more in the realm of what is achievable by skilled enthusiasts

than designing, building and marketing an odd hardware base with a processor (68060) that will probably not be developed anymore. This OS/emulator should be just a couple of hundred kilobytes of executable code, gaining on the wisdoms learned from development of N/fVDI, MiNT, all those alternative desktops, etc. Or it may be even less than that- just representing the hardware as closely as possible, with standard "atari" OS being loaded upon it, like in current emulators.

Or else, maybe the QNX, now freey available, might be used as the kernel for a new "Atari-compatible" machine, maybe using MiNT development as a bridge. Btw. QNX now runs on PowerPC too...

I have the same problem with no hope in sight.

However, I have talked to the Gribnif, the USA dealer about this.

Is best that others with the same problem contact him to let him
know I am not the only person with this problem and it needs to be addressed.

Are you saying that N.AES 2 can be ordered from System
Solutions? That information certainly hasn't been posted here
before.

The Hades also has some disadvantages. First of all, it is 3150
sFr (Swiss Francs?) or $1800+US. There is no indication about
the type or size of the harddrive that comes with it. HD Driver
no longer supports it (apparently due to the failure of the
developer to update something or another). Finally, there
hasn't been any activity on the website for over 16 months.
I agree that when the Hades came out, it was impressive. It is
still too expensive for my budget, and I wonder about the amount
of support still being provided.

Off topic, maybe!
Re--gramaphone--there's still some killer New Orleans type jazz on
scratchy 78's and the 'feel' of the music itself can't be reproduced!
Same with the 'feel' of Doowop from thec '50's! Even classical pieces
were performed with a different feeling back then. But ever since the
infamous drum machine/synth/MTV era caught hold, most of what we have is

DISCO headthrashing death music and hated Beatles re-mixes (there are exceptions)!!! But very clear on CD! WOW!! I'm impressed! I just can't wait to see somebodies nose hairs and sweat glands in a close up on HDTV.
Re: "Now if omly more people knew that at the time..."
Exactly my feeling also! Good or bad, cleaner sounding or not, faster with more memory or not.....if there's NO marketing stragedy, it dies or at the very least, flounders around!!!
John G.

This is the standard-recommended method, and of course it
works. What I don't understand is that on my Falcon I am still
modifying sets without any problems. I haven't tried making any
new ones lately, but so far, so good.

>for you in the next days ...

Could you please see if you can get NVDI to print at 720 dpi
color using the 400?

>...I bought a 760, which is ESC/P2, yesterday .

Huh? Www.epson.com declares the 760 to be "Printer Language
EPSON ESC/P Raster".

This raises two questions. First, are you sure that the 760 is
ESC/P2 (and thus that Epson's website is wrong) and second, does
the 760 print at 720 dpi color using NVDI?

BTW, thanks for staying with me on this thread. I was pretty
well convinced that we were losing support for Epson printers
(so much so, in fact, that I bought a 740 I really didn't
need). It's still going to be a good printer, but it would be
comforting to know that additional ones will be available for a
while.

I've put the Spin_SD.BOS file in there and tarrgeted it at the drive. It seems to log it OK, reporting it as a Matsushita LF-1000 and mentions something about XHDI....Metados then happily maps it using the HS-ISO.DOS as drive O:...problem is I can't access it....I can stick a PD disk in and access it as K: but not as a CDROM, even when I boot with a CDROM in the drive...

any ideas?....is it an HD-Driver thing I need to do (7.71) or do I need toi replace Metados 2.74 with the one in the SPIN distributiopn?

I know! I wouldn't either! I posted those features to give an idea of
what Apple had included on their card. We could also include these
types of components on a Milan or Atari board for use in the Mac/PC.

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs for NEW Atari stuff!!

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out
into Atari Jaguar Hardware & Games. So check out what's new on my Web
Site. I have 8 different Catalogs, & my SoftWare Catalogs are largest.
They have the biggest Byte Count. Boy! You should see my inventory! I
have Libraries of Books and Reference Material, TruckLoads of HardWare
and Crates and Crates of Software for the Classic Atari 8 Bit, Atari 64
Bit Jaguar Game Machine and the Atari ST and Newer Computer Line!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want to order and E-Mail me the rest of what you do want to order! To
expedite things, include your complete Mailing address so I can figure
Shipping/Postage and Handling. I'll be back after the weekend.

And remember, if you can't come see me today, come see me tomorrow! :-)

Please Direct all Replies Through E-Mail to: bensmith@teleport.com or
atari@benjamin.net. If you cant reach me at benjamin.net see my E-Mail/
Web info in my Signature attached to the bottom of any of my messages!

JT

I am pretty sure you can't read/write on a 1.44 floppy with Spectre GCR if
your machine doesn't have a 1.44 floppy to begin with.

My Mega STE has two 1.44 floppies but Spectre GCR doesn't know about it.

Peter

1701. SM-147 monitor question

Newsgroup: comp.sys.atari.st
Date: 2000-08-10 00:00:00 UTC
From: claytone@aa.net
Message-ID: <3993922b_1@huge.aa.net>
Source record: 58542

Hi Atarioids,

Concerning the Atari SM-147 14" mono monitor. Does this model have a speaker? If not, is there some sort of "work around" where one could just hook up a small speaker to the appropriate terminals inside an ST, or maybe off of the monitor cable or plug?

Thanks,

Clayton Murray
Seattle, WA USA

1702. Re: SM-147 monitor question

Newsgroup: comp.sys.atari.st

The Atari SM-147 is actually a Quadrant VGA paper white monitor
that was modified to work on an Atari ST series computer. Since
most IBM compatible monitors do not have speakers an external
sound source is required. I sell a monitor switch that has rca
jack audio ouput. You would need to run it through an amplifier
and speaker.

I managed to find some info on this card. Here's an article from CNET:

bring the Web to your PC
by Michael Mathog
(8/6/96)

It's a fact of life: the latest and greatest software always comes out for Intel machines first. For people who want current software but are loath to give up their Macs, Apple has introduced a 100-MHz Pentium compatibility card. This follow-up to the 486-based compatibility cards allows Power Macs to run Windows 95 applications at speeds on par with PCs based on the same processor, according to our benchmark tests.

The $1,049 (street) standalone card plugs into the Mac's PCI slot (it's also an option in some Apple systems, such as the Power Macintosh 7200/120). Along with a 100-MHz Pentium processor, the card boasts Sound Blaster-compatible hardware, SVGA, 8MB of RAM, and a DIMM slot for more memory. The card can support two monitors simultaneously, so you can run your Mac and Windows applications side-by-side.

To run Windows 95, you'll have two stumbling blocks. First, you need to buy Windows 95--the compatibility card ships with MS-DOS 6.22. Second, the shipping configuration probably doesn't set aside enough disk space to install Windows 95 or any applications. To alter the configuration, Apple forces you to contend with a surprisingly difficult utility for changing hard-disk size and reassigning drive letters.

If you install Windows 95, you'll quickly realize that the 8MB of RAM that ship with the card just won't cut it. While you can't share memory from the Mac motherboard, you can take extra RAM from your Mac and plug it into the DIMM slot on the compatibility card. It's a nice touch, helpful when you're running Windows applications that need a RAM boost.

When the Macintosh boots, the PC setup controls load and run in the background. With these controls loaded, switching between operating systems is just a keystroke away--very impressive. Networking, sound control, and CD-ROM support are all preloaded. Playing DOS games with Sound Blaster-only sound and in high-resolution DOS VESA modes--though a bit slower than on a PC--was no problem. Connecting to the Internet and our LAN also worked without a hitch. Unfortunately, you're forced to load CD-ROM support for DOS in real mode, which means we needed to load a slow, 16-bit driver to run a CD (Windows aficionados are used to faster, 32-bit virtual device drivers for CD drives).

Apple's compatibility card is one of the best solutions for people who want to run two operating systems on their Macintosh. The compatibility

card might help quell concerns about your investment in a Macintosh--although at $1,050, you'd only need to spend another $500 or so for a separate, bare-bones 100-MHz Pentium machine.

Sent via Deja.com http://www.deja.com/
Before you buy.

Hello All.
As mentioned in the passage above. I presently use my Draconis 1.7pro
for General internet use. But with Wensuite3 I use this for Newsreader.
As noted by some of the comments with fellows having trouble. I am open to help others
in there request for some answers. If there some interest, I will write a couple of
pages of help and zip or lzh format as HOWTO.

regards

A good idea, if you reverse it ;-) Put a 060, ROMs and other necessary
hardware on a PCI-card, and put it in the PC. You wouldn't even have to
use the PC if you didn't want to, and it should be a lot cheaper than
building a complete computer.

To me, the worst part is when someone actually gave links to both Milan and Medusa, yet Jared kept on saying "those don't have the Atari fuji; I refuse to accept those."

At some point, it became very clear that the only thing that makes him tick is the glorious fuji. Who gives a fuck what's inside them, as long as they're proudly made in America and wear the famous logo.

Count me out.

I disagree. The Hades made by the Medusa is a better alternative.

From the specs it is closer to an Atari, 3.06 TOS machine than a Milan II. It is in a second generation motherboard. It can support the ATI 8MB Pro Rage graphics card with special NVDI version. It can support MagiC via special HadesMagiC version. The Medusa company maded the first Atari clone 8 years ago continue with the Hades in a 2nd generation with a lower price.

The Milan is still in developement. Could take years to reach UK and USA shores.

Hello everyone, id like to announce a new project im starting, The ClassicMag project. The goal of this project is to preserve classic computing and gaming magazines for extinction. Most of us classic collectors love to have magazines for the systems we collect as, in the past the provided an immense resource for reviews, news, insights and programs. The goal of this project will be to preserve old out of print magazine issues in a PDF format. These will be scanned complete issues with advertisements let in, as they are as interesting and have just as much nostalgia value. Our web site is currently up at http://www.classicmag.net there's not a lot there as of yet but with everyone's help I hope to fill it soon. I've got a tremendous amount of space to be able to host these files. What I'm looking for is help from the community, if you have old issues, anything to do with computers or video gaming, please consider scanning them in getting them to us. If you can't put them in pdf form, no problem we can work out a way for you to get them images to us and we will get them in pdf form. I have a small list of magazines on the site now for some different systems, if you know of any I don't have listed please email with the details. I want this to be as complete as possible. I'm going to try and stay with mags published before 1995. I don't want to run into a lot of copyright issues. As always if a mag is on our site and the publisher, if there still around, wishes it not be there we will take it down, but hope they consider this project worthwhile and let us keep them there.
I believe this will be a great resource for everyone to be able to get a hold of some mags that are gone, but not forgotten. If you want to help with this project please email me at jim@classicmag.net . I look forward to hearing from people.

Thanks
Jim Oaks

> Since the human ear can only distinguish pulses of 1/40000 or
> 1/50000 (depending on the human), recording of better than CD or
> DAT quality are of no additional value (for human use, anyway).

Actually human perception for pitch usually tops out at 20kHz (depending on age anyway) but there are also several other aspects like perception of phase difference, which if i recall correctly, was around the 5-10 microseconds. (somewhere between 100-200 kHz).
So even the standard 96kHz for DVD audio is still below the limits of our ears.
But for the practical part, a simple resample from 49.someting to 44.1 should work okay for game stuff, but highquality resampling will take a significant ammount of precessing power.
The main thing i'm curious about in the falcon emulator will be the DSP emulator anyway. There are plenty 68kx emulators out there, but i havent come across a realtime 56k emulator yet. I'm not saying its impossible, but it will take a LOT of time to get one of these working, and i wonder if this is all worth the effort, which may have been spent on making some falcon software.
Since we're on the subject of dsp anyway.. did anybody managed to make a port of gcc56k for falcon ?
It would be nice to have this software running on the falcon instead of on the sparc.

bye

To the best of my knowledge, none were ever sold. Look back
up this thread, I posted about my experience here. And that
the TT Colorburst hand scanner used both the cart port and
printer port.

> us keep them there.

IMO, this is not the way to go. Take the time to get permission FIRST.
It can be difficult to find the copyright holder and convince them to let
you put the material online, but it is worth the effort.

It is just safer to have the copyright holder's blessing before you start.
First, it means you won't get sued. Second, it means you'll save a ton
of work. What happens when you've just finished scanning the 100th
issue of PCjr Lover's Journal when you receive the cease and
desist letter from OmniMegaMediaPublishingCorporation, which now owns
the rights to that material? You'll have to remove the files
and will have wasted a whole lot of time and effort.

Sometimes, it is easier to get permission than forgiveness.

Also, I'll add that some publishers may not be able to even grant rights.
Many magazine contracts let the author retain copyright, in which case
you might have to track down hundreds of authors. I write magazine
articles for a living, and when I find someone has reproduced my work
without my permission, you can bet they'll hear from me. Even years
after the fact. It's still MY work.

One other thing -- less of a rant and more of a friendly suggestion.
Instead of trying to get every different magazine online at once, pick a
favorite, get permission, and work on getting every issue of that
publication online. That way you're not spread as thin. I've been heading
up the Digital Antic Project for four years, and we have just five issues
left to scan of the 88 that were published. I can see the light at
the end of the tunnel and it feels good.

If you do decide to focus on one magazine, you might want to use your
site (great domain name, by the way) to link to the other online magazine
projects like Antic, the Digital ANALOG Magazine archive, etc.

By the way, I have received permission to put Creative Computing magazine
online, although I have made to plans to do it myself... If you or
someone else wants to make that their project, let me know.

Greetings everyone,

The Atari PC's were available in Canada. I saw a used one for sale in 1993 in a dealer literally right next door to where I went to user group meetings in Toronto. A friend of mine also had one.

As for a machine running tos & dos in the same computer it reminds me of the 1040STe+ that unfortunately was never mass produced in great numbers. Or those Supercharger boxes that plugged into the ACSI port and had a real 8086 processor and its own ram, the only "emulator" I had much respect for.

That can only be a Mac G.. running MacOs and MagicMac.
Unless somebody has ported TOS/GEM to run native on a powerPC. But then still you need to emulate the Atari programs. Something Jared wont like if I remember well. :-)

Yes. Remaining roblem is the speed of the 68060, which is limited to 80 MHz
(Anybody realizes you wont have HW floating point?)

There is another solution: Install Linux (The kernel only), port the AES/VDI to run
native on the PC replacing X, write a emulator but dont call it 'emulator', call
it 'microcode'. :-) Run Atari programs.

Hey, there is a open source project called OTOSIS/OVDISIS/OAESIS that is
doing something like that.
The fact that this project seems to be more than 5 years old, and still is under
construction is a indication of how difficult this all is.

>with the cable...

That's the same mouse as I have, and sometimes it likes to wander,
sometimes up or down, although more often it's goes left or right. A
quick tap of the mouse mat will stop it dead in its tracks. All this
leads me to think that it's because the keyboard controller is getting
an intermittent signal from the mouse, from one of the optical sensors,
and it thinks the mouse is moving. The slight tap moves the mouse a
fraction and either blocks the light path completely, or opens it up
completely.

Maybe it really is not the dealers (except Software Service Seidel
where I had troubles several times) since quite often my 2nd or 3rd
Email gets answered and it's surely not less work for a dealer to
throw away some mails and then randomly answering others. BTW snail
mail seems to be a problem too there. So it's good to convince the
dealer that he should send the goods as package and not as letter
since the chance of it arriving is much higher then and in case
of problems there is an insurance covering it.

Why not just make an ATX motherboard, and nothing but a motherboard.
Buyer can pop it into a a widely available ATX case, use plain old PC
floppies and IDE devices. Either have built in video or use PCI cards...

Hi all,

The home of DDP Translations gets an update - I've simplified its layout and it's now much quicker to load.

I've also added two more translated apps to the DDP page - XGem (alter the appearance of MagiC window title bars), and ITime (an online timer for IConnect). The RSC file archive for MagxDesk has received a bug-squash too.

Pop along - the URL is in the sig - if you're a north/Herts (UK) resident then why not attend a Cheshunt Computer Club meeting?

From: Callum Lerwick <lerwick@tcfreenet.org>
Message-ID: <3993A5F5.AD096FF7@tcfreenet.org>
Source record: 58558

Okay, I quietly slipped off to the PC about 5 years ago and became a Linuxhead and such. But I still have a Mega4 ST laying about. Just for kicks I'd like to get it on the net. What options do I have? I'm a unix geek so I'm thinking MiNT. I've just leeched KGMD, I messed with it when it was new but the 2mb RAM I had at that point wasn't enough. Is there anything I should know? Any newer KGMD's than 1.0 circa 1995? Thought there was an english transelation of KGMD somewhere... Anything I should update? Any Y2K bugs? ;)

I figure I'll run a null modem PPP connect to a Linux box. I have various Linux boxen connected on a LAN NATted on a cable modem... But is there by any chance anything to do PLIP from an Atari to a Linux PC over a Parcp cable? Apparently the linux kernel supports an eight bit bidirection mode now, but doesn't seem to be quite the same cable wiring... Should be much faster. ;)

My goal is to have it be a web server. Is there any up already?

Replies CC'd to email would be good...

Thats the URL for the Atari Software Exchange that's also run by Steve, it should be able to get it from there but Last PD also has it's own URL at www.last-pd.co.uk

You could try whether it helps to use the Epson 440 driver. If you're
interested I could check if the speed of the Falcon has influence on
the printing speed too. I printed a Papyrus A4 document with text and
pictures on my Epson 400 yesterday and with 360 dpi full color option
it needed 2:40, with 720 dpi it needed 4 minutes but I did it on
a Centurbo II Falcon in turbo mode. Maybe it's slower on an
unaccelerated Falcon.

> Could you please see if you can get NVDI to print at 720 dpi
> color using the 400?

After installing the 400 using the instprnt utility the printer accessory of NVDI let me choose between three modes :
- 360 dpi draft
- 360 dpi best
- 720 dpi best
I just tried printing a Papyrus A4 document with mixed text and pictures via NVDI in 360 and 720 dpi. With 360 dpi it needed 2:40 and with 720 dpi 4:00. But I'm quite sure that I needed the (free) upgrade from NVDI 5.0 to 5.02 to get it to work with the 400.

Since Epson's Austrian website says different the best thing will be to try it :) . You can read the result in this thread next wednesday.

> BTW, thanks for staying with me on this thread. I was pretty
> well convinced that we were losing support for Epson printers

Thanks for staying with me :) I'm very unhappy that Epson only sees Windows users as their target customers, even the more since I like the Epson printers more than the HPs.

> (so much so, in fact, that I bought a 740 I really didn't
> need). It's still going to be a good printer, but it would be
> comforting to know that additional ones will be available for a
> while.

With the 740 you have the advantage that you can select exactly that model with instprnt (at least in NVDI 5.02) while the 760 is not in the list. But I'm pretty sure that it either is compatible enough to work or that there is a printer update for NVDI which includes the 760 (I will try to get one).

Note that Norwegian developper Odd Skanke developped several
patches to most of the Hades problems.

Sorry, I don't have a URL, but starting at www.bright.net/~atari/
should give you one, as Lonny Pursell recently transfered the
Atari Clone Directory to Odd. There probably is some note about
the change, somewhere on Lonny's site.

>TT.

I want to correct a mistake I made about the GT Look II software.
The software does not work thru the Cartridge port.
I booted up the software and there are alot of port options ...
Serial, Parallel Internal, Parallel External, Parallel+Midi, and
SCSI Internal or SCSI External.
I read a review of the GT LOOK II software in ST Format issue 77 and
it works with Epson flatbed scanners on the ST and Falcon.
I think there was some type of lead you need to run it on the ST, not sure
what kind of cable it is.

I dug out my MiGraph order form and these 3 Color Scanners were available
for the Falcon and TT back in 1994.

MS1200 and MS2400 24-bit Color Flatbed Scanners w/ColorKit Pro Software.
The 2 above used the SCSI port. There were 2 or 3 options for these
such as a Transparency Scanning attachment and Doc. Feeder.

And the ColorBurst color hand scanner for the Falcon and TT that used the
Parallel printer port on the Falcon. I have one of these, not sure if it
uses the parallel port on the TT but probably does.

Also there is a PS-400 Wand Scanner which is a Mono Scanner for the ST series.

Anyone out there have one of these MS1200 or MS2400 scanners or were none of
these ever sold?

If there was a MiGraph Color Wand Scanner that connected to the cart port on the Falcon, I've never heard of it. Sounds interesting, Anyone out there have one of these? If so, tell us something about it.

I do know that MiGraph was suppose to make a cartridge port connector that allowed their ST Series of hand Scanners to work with the Falcons Cart port, but don't know if it was ever made? Anyone know? Sure could use one here.

Also, I'm looking to buy/trade for a working PS-400 Wand Scanner for the ST computers. Would like to have the Sheet Feeder as well but not necessary.

Also, need a good Hand Scanner Scanning Tray and MiGraphs MERGE IT software.

From: phantomm@eastky.net
Message-ID: <8mvjgc$il1$3@nd.eastky.net>
Source record: 58565

I could use some info on any Video Genlocks made for the Atari ST machines and especially any made for the Falcon.

I remember reading a few articles awhile back but can't remember any models or names of software.

Also, I've heard some folks say that the ones that were made were not any good.

Even if that is true, I'd still like to know what kind of Video Genlock hardware and software was made for the Ataris and if any can still be bought new. Anyone got a good used one for sale/trade?

If anyone happens to have one for the ST and or Falcon then do pass along any info you can.

Not sure but I think there was one or two that were made especially for the Falcon. If so, those are the ones I would have the most interest in.

Also, does anyone know if there is a Hardware only Genlock that one can use on any type of Computer including the Ataris that will allow me to mix either my Falcons RGB or VGA output video with another video signal such as the TV or VCR video Tape?

I'd like to find a good DIY project for this also, surely it can't be that hard to come up with one.

I notice that Apex Media has a Genlock option, Anyone know if any Genlock will work with Apex or is there a certain model that needs to be used?

Any help is much appreciated,

It's worse than that. There is no SpareMiNT installation kit
that someone could use from scratch.

Currently, one still needs to install KGMD or some other kit,
then alter the filesystem hiererchy for FHS, then install the RPM
package manager and cpio.

In other words, SpareMiNT is still not a proper distribution kit.

Better use Ronald Andersson's new PLEP protocol, anyhow.

Really? I scratched an ext2-partition, unpacked the rpm bootstrap archive
to it, symlinked the folders to u:\, rebooted and started installing rpm
packages. Apart from tar.ttp and gzip.ttp I didn't need anything.

OK, so it's not plug and play but if he's a unix-man he won't have any
problems with it. It's just a matter of reading the docs in the rpm
bootstrap archive.

> Currently, one still needs to install KGMD or some other kit,

Definitely not true, see above.

> In other words, SpareMiNT is still not a proper distribution kit.

That's true. The init-package doesn't work too well yet, fortunately I
don't need it on my TT so I really don't care ;-)

And I'm telling you, there are visual differences between 1.1.7 and
1.2.0. Just start it up and see for yourself. The keyword "new3d" wasn't
introduced in 1.2.0 for no reason. In 2.0.0 there are even more changes,
but I'm not talking about these.

Check out my y2k page at:

http://www.bygjohn.co.uk/atari/y2k.html

There you'll find an XBIOS patch to sort out an internal clock problem
on TOS 1 and 2, and a workaround patch for your cartridge clock.

NB The cartridge clock patch won't work properly without the XBIOS patch
installing first, so Auto folder order is important.

I had one for the ST, made by a French company called GST I think. I
tried to get it to work with the Falcon, as it seems to be one that is
hardware based and should work with any RGB source. I worked out the
pinouts and got Sys Sol to make a custom cable, but it didn't work!
In theory, it *should* have worked as all it requires is RGB signals
and synchs, which the Falcon provides.

The only thing was that you had to run a program on the ST to synch
its video display to the genlock.

There are also generic PC and Mac genlocks available (have a look in computer
supplies catalogues) that should work with any VGA source. Again,
these look to be entirely hardware.

The Falcon has its own genlock facilites via software - you can set it
in a graphics mode where each pixel has a bit that says whether it's
transparent or not, but I don't know if there's anything that has used
this. Maybe this is the way Apex works.

"Henk Robbers" <H.Robbers@cable.A2000.nl> wrote in message
news:3993326A.7E38753@cable.A2000.nl...

: There is another solution: Install Linux (The kernel only),
: port the AES/VDI to run native on the PC replacing X, write a
: emulator but dont call it 'emulator', call it 'microcode'. :-)
: Run Atari programs.

This is the only sensible idea in this "waking up the dead"
thread. Crassly speaking, there are merely two logical reasons
for wanting to produce an Atari-clone of sorts: Superiority in
the look and feel of the GUI, or superiority in one or more
"killer" applications. A third would be real "power without the
price", but that one is definitely out of the question...

The world has moved on, and a superiority of the Atari-specific
GUI is now in the fantasy domain. Everybody's got windows, icons
and dropdown menus. A "killer application" that would work
better on an Atari Motorola clone than on an Intel or PPC system
is v-e-r-y unlikely. Like they say in America, "there's no
substitute for cubic inches" (referring to automobile engines).

If someone comes dragging with Cubase, forget it. There's a port
of Cubase for the Intel BeOS which has no problems with timing
etc. BeOS is free BTW.

Just face it. Even if Dr Frankenstein could blow life into a
body assembled of various bodyparts he dug up at the graveyard,
that *monster* would suffer from several serious drawbacks.
Being unloved and ugly would be the most socially important.

Motorola's 68*** CPUs are in fact bodyparts from the graveyard,
dated and slow. Not even Motorola is any longer marketing them
for desktop systems. So why bother digging up the dead?

Rodolphe Czuba had a readymade and working prototype of a
twin-68060 motherboard (the Phenix) with some amazing specs, but
nobody was buying it.

A desktop computer system today is so much more than just the OS
and a text editor. The hangaround software expected to just be
there are at least a good Internet browser, some type of an
office suite and a wide range of drivers for all possible
hardware. Then, as a topping to this, buyers are also expecting
something *excellent*, which the other guys don't have.

Starting up a clone production and maintaining the interest for the product is a game for the big boys, with litterally millions of dollars to spend. Unless you are one, stop dreaming.

That doesn't work at all. The only way to make sure your SCSI-devices will
work with HDdrviver >7.70 is by switching of the instruction cache.
However by doing so the Hades turns into a slow machine. I believe just a
little bit faster then a TT030.
HDdriver 7.60 works very good on the Hades 060.

Sorry for the late reply.
Yes, the latest one is 0.97 but it's only German. The major improvement is
that that version supports long file names and true color.
You can find it on the home page of the author. As it is a beta version I
didn't place it on the Belgian ftp-server.

Message-ID: <399459ba.251777@news.in2home.co.uk>
Source record: 58594

Titan Designs (now Cortex) did in fact produce a hardware genlock
device for the Falcon, one of which I have had for a few years now
(and sorry, it is not for sale, either :)). They also produced the
video digitizer hardware, Expose - and AFAIK Cortex * may * (but don't
quote me on this) have some of these left, in NTSC versions.
The Expose is very good and easily out-performs most PC video
digitisers of that time and some of those around now.

Cheers,

Felice - Maggie Team INC

Hmm, maybe I'm wrong with the date, but I'm pretty sure AG Computertechnic
doesn't exist as such anymore. However if one of his former customers has
a problem he will help them but only in his sparetime.
I remember me that he has announced his departure in one of the maus
groups.

That's news to me. The whole MiNT mailing list got a notice
from Torsten Lang that Axel was selling a whole bunch of network
cards and that was some time this spring, AFAIR.

> but at the time he was in business it was very hard to get an
> answer from him.

Several of us had e-mailed him for various cards, at the time.
Not many got any reply at all.

At one point, during a phone conversation, Axel mentioned he had
acquired the schematics to the Riebl Ethernet card and offered
them to me. No wonder I never got any further news, nor the
schematics, since he's gone...

I don't know about "earlier", Steve, but can we clarify this: is the Help Key useful and accurate (about Key shortcuts) under TOS 1.xx or 2.xx or only 3.xx or what?

My previous comp was a Mega One (stolen by the repair firm!) which used HELP, though I can't remember its outcome. The TT & Hades give accurate info under TOS 3.05/3.06.

What's your experience?

Charles.

1777. Re: Draconis1.7pro+WenSuite3 user

Source record: 58460

Hello All.
As a Draconis user it's true that some of the sites can be troublesome.
So I just deselect Javscript setting. Sometimes it not the software but the site on visit.
Java is mainly for the implemation of sound and vision on web pages. So you can see
the problem for Atari straight away. Most of the time, i visit a site and it works fine
then I keep it in a created folder Then try with the WenSuite3 to see if it work aswell.
True I have luck most of the times in both worlds, when it comes to emails ftp and
good well maintained sites Draconis wins hands down. But with access and ease to
newsgroups plus in built email and web browsing, WenSuite3 is a lot easier to use.
I am not here to promote any but, I would like to ask anyone. If the future of
web access is to be made easier with installation user friendly, why cannot we have the
same.

regards.

Hi Jim,

> Hello everyone, id like to announce a new project im starting, The
> ClassicMag project.
Nice idea.

>The goal of this project will be to preserve old out of
> print magazine issues in a PDF format.
That's a helleva lot of work but the ideal format.

> I'm going
> to try and stay with mags published before 1995. I don't want to run
> into a lot of copyright issues.
Although Atari Computing is now defunct and rengade publishing retains
copyright we're happy to give you permission to include our entire output on
your site if you want to do the work. There are 16 issues in total so it's a
large project to scan them all. Where are you based?

Regards

Joe Connor
renegade publishing ltd

PS In case anyone is wondering what I've been up to since Atari Computing
closed my website is at www.renpub.net and my latest fun project is
www.cantBarsed.com

We're offering FREE webmail accounts in the form <you>@cantBarsed.com and
our message board has just gone online and if you'd like to say hi you'd be
most welcome!

As always if a mag is on our site and
> the publisher, if there still around, wishes it not be there we will
> take it down, but hope they consider this project worthwhile and let
> us keep them there.
> I believe this will be a great resource for everyone to be able to get
> a hold of some mags that are gone, but not forgotten. If you want to

Woof, woof :-)
There will (alomost certainly) be a November AMS2000 show, the hall is
booked and I am involved helping the organiser and we'd love to have a
better Atari presence that made it to the Spring event (SAMS2000).

The place to register your interest and monitor the situation is at the
organiser's website at:

www.sharward.co.uk, follow the Giant Computer fair link...

Sadly neither Mark Wherry nor I could summon up the necessary enthusiasm to
complete this project. I have quite a few cheques here which we will not
cash and I'll return the CDs some people enclosed in the near future.
I'm really sorry to contribute to the vapourware legacy of the Atari scene.
Maybe someone would like to take over the project?
